The table above details modifications made to the EUT during the test programme. The modifications incorporated during each test (if relevant) are recorded on the appropriate test pages.

## 1.7 TEST METHODOLOGY

All measurements contained in this report were conducted with ANSI C63.4-2009, American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 kHz to 40 GHz.

For conducted (if applicable) and radiated emissions the equipment under test (EUT) was configured to measure its highest possible emission level. This level was based on the maximized cable configuration from exploratory testing per ANSI C63.4-2009. The test modes were adapted according to the Operating Instructions provided by the manufacturer/client.

## 1.8 TEST FACILITY

### 1.8.1 FCC – Registration No.: US5296

TUV SUD America Inc. (San Diego), is an accredited test facility with the site description report on file and has met all the requirements specified in §2.498 of the FCC rules. The acceptance letter from the FCC is maintained in our files and the Registration is US5296.

### 1.8.2 Industry Canada (IC) Registration No.: 3067A

The 10m Semi-anechoic chamber of TUV SUD America Inc. (San Diego) has been registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No. 3067A.

## 1.9 SAMPLE CALCULATIONS

### 1.9.1 LTE Emission Designator (QPSK)

Emission Designator = 4M51G7D

G = Phase Modulation

7= Quantized/Digital Info

D = Combination (Audio/Data)

### 1.9.2 LTE Emission Designator (16QAM)

Emission Designator = 4M50W7D

W = Frequency Modulation

7= Quantized/Digital Info

D = Combination (Audio/Data)

### 1.9.3 Spurious Radiated Emission (below 1GHz)

Measuring equipment raw measurement (dB $\mu$ V) @ 30 MHz			24.4
Correction Factor (dB)	Asset# 1066 (cable)	0.3	-12.6
	Asset# 1172 (cable)	0.3	
	Asset# 1016 (preamplifier)	-30.7	
	Asset# 1175(cable)	0.3	
	Asset# 1002 (antenna)	17.2	
Reported QuasiPeak Final Measurement (dB $\mu$ V/m) @ 30MHz			11.8

### 1.9.4 Spurious Radiated Emission – Substitution Method

Example = 84dB $\mu$ V/m @ 1413 MHz (numerical sample only)

The field strength reading of 84dB $\mu$ V/m @ 1413 MHz (2<sup>nd</sup> Harmonic of 706.5 MHz) is the maximized measurement when the EUT is on the turntable measured at 3 meters. The gain of the substituted antenna is 7.8dBi while the transmit cable loss is 1.0 dB (cable between signal generator and the substituted antenna). The signal generator level is adjusted until the 84dB $\mu$ V/m level at the receiving end is replicated (identical test setup, i.e. same antenna, cable/s and preamp). If the adjusted signal generator level is -18dBm, then we have the following for both EIRP and ERP as required:

$$\begin{aligned} P_{\text{EIRP}} &= -18 \text{ dBm} + 7.8 \text{ dBi} - 1 \text{ dB} \\ &= 11.2 \text{ dBm} \end{aligned}$$

$$\begin{aligned} P_{\text{ERP}} &= P_{\text{EIRP}} - 2.15 \text{ dB} \\ &= 11.2 \text{ dBm} - 2.15 \text{ dB} \\ &= 9.05 \text{ dBm} \end{aligned}$$

### 2.1.2 Standard Applicable

- (a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.
- (c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

## 2.2 EQUIVALENT ISOTROPIC RADIATED POWER

### 2.2.1 Specification Reference

Part 27 Subpart C §27.50 (d)(4), Part 2.1046, RSS-139 Issue 2 (6.4)

### 2.2.2 Standard Applicable

(4) Fixed, mobile, and portable (hand-held) stations operating in the 1710–1755 MHz band are limited to 1 watt EIRP. Fixed stations operating in this band are limited to a maximum antenna height of 10 meters above ground. Mobile and portable stations operating in this band must employ a means for limiting power to the minimum necessary for successful communications

### 2.2.3 Equipment Under Test

Serial No: 20130418001833

### 2.2.4 Date of Verification/Initial of test personnel who performed the calculation

May 17, 2013/FSC

### 2.2.5 Additional Observations

- EIRP was calculated as per Section 1.3.2 of KDB412172 D01 (Determining ERP and EIRP v01).
- Calculation formula in logarithmic terms:

$$\text{EIRP} = \text{P}_T + \text{G}_T - \text{L}_C$$

Where:

$\text{P}_T$  = transmitter conducted output power dBm (Section 2.1 of this test report)

$\text{G}_T$  = gain of the transmitting antenna, in dBi (EIRP);

$\text{L}_C$  = signal attenuation in the connecting cable between the transmitter and antenna, in dB (EUT uses integral antenna, this value is negligible).

## 2.3 EFFECTIVE RADIATED POWER OUTPUT DATA

### 2.3.1 Specification Reference

Part 27 Subpart C §27.50 (b) (10)(12) and Part 2.1046

### 2.3.2 Standard Applicable

(b) The following power and antenna height limits apply to transmitters operating in the 746–763 MHz, 775–793 MHz and 805–806 MHz bands:

(10) Portable stations (hand-held devices) transmitting in the 746–757 MHz, 758–763 MHz, 776–793 MHz, and 805–806 MHz bands are limited to 3 watts ERP.

(12) For transmissions in the 746–757, 758–763, 776–787, and 788–793 MHz bands, licensees may employ equipment operating in compliance with either the measurement techniques described in paragraph (b)(11) of this section or a Commission-approved average power technique. In both instances, equipment employed must be authorized in accordance with the provisions of §27.51.

### 2.3.3 Equipment Under Test

Serial No: 20130418001833

### 2.3.4 Date of Verification/Initial of test personnel who performed the calculation

May 17, 2013/FSC

### 2.3.5 Additional Observations

- ERP was calculated as per Section 1.3.2 of KDB412172 D01 (Determining ERP and EIRP v01).
- Calculation formula in logarithmic terms:

$$\text{ERP} = \text{P}_T + \text{G}_T - \text{L}_C - 2.15\text{dB}$$

Where:

$\text{P}_T$  = transmitter conducted output power dBm (Section 2.1 of this test report)

$\text{G}_T$  = gain of the transmitting antenna, in dBi (EIRP - the -2.15 in the formula is to convert EIRP to ERP);

$\text{L}_C$  = signal attenuation in the connecting cable between the transmitter and antenna, in dB (EUT uses integral antenna, this value is negligible).

### 2.4.3 Equipment Under Test and Modification State

Serial No: 20130418001833 / Test Configuration A

## 2.5 PEAK-AVERAGE POWER RATIO

### 2.5.1 Specification Reference

Part 27 Subpart C §27.50(d)(5), RSS-139 Issue 2 (6.4)

### 2.5.2 Standard Applicable

(d) The following power and antenna height requirements apply to stations transmitting in the 1710–1755 MHz and 2110–2155 MHz bands:

(5) Equipment employed must be authorized in accordance with the provisions of §24.51. Power measurements for transmissions by stations authorized under this section may be made either in accordance with a Commission-approved average power technique or in compliance with paragraph (d)(6) of this section. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

### 2.5.6 Environmental Conditions

Ambient Temperature	25.6°C
Relative Humidity	39.8%
ATM Pressure	99.0 kPa

### 2.5.7 Additional Observations

- This is a conducted test. Test procedure is per Section 3.0 of KDB971168 (D01 Power Meas License Digital Systems v01).
- Measurement was done using the Spectrum Analyzer's Complementary Cumulative Distribution Function (CCDF) measurement profile. The built-in function is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth (crest factor or peak-to-average ratio). A CCDF curve depicts the probability of the peak signal amplitude exceeding the average power level. Most contemporary measurement instrumentation include the capability to produce CCDF curves for an input signal provided that the instrument's resolution bandwidth can be set wide enough to accommodate the entire input signal bandwidth.

- All channels based from worst case configuration channel bandwidth were verified. Only the worst channel presented.
- There are no measured PAR levels greater than 13dB. EUT complies.

#### 2.5.8 Test Results

The worst case measured PAR level was 7.19dB (0.1%) at 1745.0 MHz using 16QAM with a 20MHz BW.

### 2.9.6 Environmental Conditions

Ambient Temperature	23.1°C
Relative Humidity	49.0%
ATM Pressure	99.0 kPa

### 2.9.7 Additional Observations

- This is a conducted test. The EUT was operated at 13.5VDC nominal voltage and was placed in the temperature chamber for this evaluation. The EUT was controlled by a CMW500 and the maximum frequency error was monitored through a Spectrum Analyzer using marker frequency count function. The results are compared to the CMW500 carrier frequency error TX Measurement application.
- The Temperature was reduced to -30°C and allowed to sit for 1 hour to allow the equipment and chamber temperature to stabilize. The measurements on both Band 4 and Band 13 were then performed. The temperature was then increased by 10°C steps and allowed to settle before taking the next set of measurements.
- Voltage variation was also performed at 85% and 115% of the nominal voltage.
- Only worst case configuration presented. See Section 1.4.4 of this test report for details.
- The maximum frequency deviation was verified against the frequency band edges using the EBW data. Sample calculation:

LTE Band 4 worst case frequency error:	16.74 Hz
Worst case EBW (-26dB) of LTE Band 4 20MHz BW:	19.796 MHz

*Edge of fundamental emission (1745.0+(19.796/2)) :* 1754.898 MHz
