Subject: Device Operation Description
Device: eTrak ETC100

The eTrak ETC100 is a location tracking device with a panic button. It is intended to be used to provide security and safety for people. The device checks its position periodically, and when it senses a new position, it will update the location to our server. The caregiver can log into our secured online tracking portal and see the last known location information. The device carrier would carry the device in a pocket, loop through a belt using a pouch, attach to a key ring, put it backpack, etc. He or she would use the panic button if there's an urgent or emergency situation.

Sincerely,

A handwritten signature in black ink, appearing to read "Sang Pheng".

Sang Pheng
