Operational Description for Wireless Optical Mouse, FCC ID: P5AB71

- Mouse: (1) Once the mouse makes a move, the IRPD will detect the glide signal and transmit the signal to MCU.
 - (2) The MCU converts and modulates the signal using FSK mode.
 - (3) The mouse transmits the modulation signal on frequency of 27 MHz.
- Receiver: (1) Once the receiver receives the modulation signal, it will demodulate the signal through RF circuit and will respond with signal to MCU.
 - (2) The MCU meeting converts the signal into an acceptable format received by PC.
