Hi Tom,

Please address following issues.

Q#1: As indicated in application form and test report, this is a 5.8 GHz 802.11n High Power Mini-PCI Card but all related documents, for example, operational description and test report do not support it. Please address.

ANS1 This radio module has one TX output only. The Atheros card is an 802.11n card, but Tropos only uses 802.11g legacy and 802.11a 5.8 GHz legacy settings.

Q#2: Please confirm if this device is seeking to comply with 15.247(c)(1) as a fixed point to point device.

ANS2 The P2P and P2MP issues are addressed in the revised instruction manual for the professional installer.

Q#3: Please provide antenna specification.

ANS3 Three antenna data sheets attached

Q#4: Please include label location to the label format exhibit.

ANS4 Label location photo attached

Q#5: Please update the MPE report to calculate it in power density.
