Dear Ian

Please see images below, illustrating that the FOBBER keyfob uses a single PCB with 8 possible switches. These are realised by the overlay sticker having the chosen idents on it.

All variants use exactly the same circuit and operation, and all variants have the same 8 input switches the chosen number of switch inputs are only realised with the relevant overlay sticker is applied.

I confirm we are happy with the reported low field strength measured from the device during your tests.

Yours Sincerely

John Fairall
