

Test Report Addendum

4. I note that the submitted FHSS test report is “identical” to the FHSS test report submitted for FCC ID: P9X-420CL1W. Normally some pre-scan tests must be performed on FCC ID: P9X-420CL1WNZ in order to assure that results from FCC ID: P9X-420CL1W are representative. I see no mention of such testing in the submitted test report. Please address.

R: The FCC ID: P9X-420CL1WNZ module is identical to the FCC ID: P9X-420CL1W module except that the Zigbee chip and it's support components have been removed. It uses the same board layout. Therefore the conducted test data from the P9X-420CL1W is valid for the P9X-420CL1WNZ unit. Radiated tests were verified for the DSS with a single channel/ single antenna (6dBi) on the NZ unit. As this verification proved that only minor variations in the below 1000MHz were seen (new low frequency points are in the test report) the other data was imported from the P9X-420CL1W radiated testing.
