Abstract

This report has been prepared on behalf of Cooper Power Systems to support the attached Application for Equipment Authorization. The test report and application are submitted for a Frequency Hopping Spread Spectrum Transmitter under Part 15.247 (10/2009) of the FCC Rules and Regulations and Spectrum Management and Telecommunications Policy RSS-210 issue 8 of Industry Canada. This Certification Test Report documents the test configuration and test results for the Cooper Power Systems RFN430EL-A3 Module.

Testing was performed on an Open Area Test Site (OATS) of Washington Laboratories, Ltd, 7560 Lindbergh Drive, Gaithersburg, MD 20879. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. The Industry Canada OATS numbers are 3035A-1 and 3035A-2 for Washington Laboratories, Ltd. Site 1 and Site 2, respectively. Washington Laboratories, Ltd. has been accepted by the FCC and approved by ACLASS under Certificate AT-1448 as an independent FCC test laboratory.

The Cooper Power Systems RFN430EL-A3 Module complies with the limits for a Frequency Hopping Spread Spectrum Transmitter device under FCC Part 15.247 and Industry Canada RSS-210.

1 Introduction

1.1 Compliance Statement

The Cooper Power Systems RFN430EL-A3 Module complies with the limits for a Frequency Hopping Spread Spectrum Transmitter device under FCC Part 15.247 (10/2009) and Industry Canada RSS-210 issue 8.

1.2 Test Scope

Tests for radiated and conducted (at antenna terminal) emissions were performed. All measurements were performed in accordance with FCC Public Notice DA-00-705 "Measurement Guidance for Frequency Hopping Spread Spectrum Systems. The measurement equipment conforms to ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation.

1.3 Contract Information

2 Equipment Under Test

2.1 EUT Identification & Description

The RFN430EL-A3 Module is a radio communications device designed for use in Electric meters. It can also be used in Cooper Power Systems Gateways and Relay Nodes. The RFN430EL-A3 Module provides a 915 MHz radio interface to an RF mesh network.

Table 1: Device Summary

ITEM	DESCRIPTION
Manufacturer:	Cooper Power Systems
FCC ID:	P9X-RFN430EL-A3
IC:	6766A-RFN430ELA3
Model:	RFN430EL-A3
FCC Rule Parts:	§15.247
Industry Canada:	RSS210
Frequency Range:	902.75 – 927.25MHz
Maximum Output Power:	27.90dBm (616.6mW)
Modulation:	FSK
Occupied Bandwidth:	491.58 kHz
Keying:	Automatic
Type of Information:	Data
Number of Channels:	50
Power Output Level	Variable from -30.51dBm to 27.90dBm
Antenna Connector	MCX
Antenna Type	3 antennas: GH908U-PRO 900MHz Omnidirectional – 8dBi Gain TRA9023NP - Antenex Phantom 902-928MHz – 3dB Gain 915MHz Co-linear Antenna -2dB gain
Interface Cables:	None (plug in module)
Power Source & Voltage:	13.5VDC
Emission Designator	492KFXD
Highest TX spurious Emission	108.5uV/m@3m- 406.39MHz
Highest RX Spurious Emission	156.7uV/m @ 3m- 366.06MHz

2.2 Test Configuration

The Cooper Power Systems RFN430EL-A3, Equipment Under Test (EUT), was operated from a 13.5VDC power supply. Programming commands were sent from a support laptop via a custom RS232 adaptor board to a header on the EUT module. The maximum power setting was attained by using the power setting command 'setbias20 1850'. The manufacturer must not exceed this setting during production.

2.3 Testing Algorithm

The RFN430EL-A3 was programmed for operation from a support laptop via a custom RS232 adaptor board to a header on the EUT module. UTF-8 TeraTermPro console program was used on the support laptop to enter commands setting the EUT to the desired channel or hopping mode.

Worst case emission levels are provided in the test results data.

2.4 Test Location

All measurements herein were performed at Washington Laboratories, Ltd. test center in Gaithersburg, MD. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. The Industry Canada OATS numbers are 3035A-1 and 3035A-2 for Washington Laboratories, Ltd. Site 1 and Site 2, respectively. Washington Laboratories, Ltd. has been accepted by the FCC and approved by ACLASS under Certificate AT-1448 as an independent FCC test laboratory.

2.5 Measurements

2.5.1 References

FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems

ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation

ANSI C63.4 Methods of Measurement of Radio Noise from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

2.6 Measurement Uncertainty

All results reported herein relate only to the equipment tested. The basis for uncertainty calculation uses ANSI/NCSL Z540-2-1997 with a type B evaluation of the standard uncertainty. Elements contributing to the standard uncertainty are combined using the method described in Equation 1 to arrive at the total standard uncertainty. The standard uncertainty is multiplied by the coverage factor to determine the expanded uncertainty which is generally accepted for use in commercial, industrial, and regulatory applications and when health and safety are concerned (see Equation 2). A coverage factor was selected to yield a 95% confidence in the uncertainty estimation.

Equation 1: Standard Uncertainty

$$u_c = \pm \sqrt{\frac{a^2}{div_a^2} + \frac{b^2}{div_b^2} + \frac{c^2}{div_c^2} + \dots}$$

Where u_c = standard uncertainty

a, b, c, \dots = individual uncertainty elements

$Div_{a, b, c}$ = the individual uncertainty element divisor based on the probability distribution

Divisor = 1.732 for rectangular distribution

Divisor = 2 for normal distribution

Divisor = 1.414 for trapezoid distribution

Equation 2: Expanded Uncertainty

$$U = ku_c$$

Where U = expanded uncertainty

k = coverage factor

$k \leq 2$ for 95% coverage (ANSI/NCSL Z540-2 Annex G)

u_c = standard uncertainty

The measurement uncertainty complies with the maximum allowed uncertainty from CISPR 16-4-2. Measurement uncertainty is not used to adjust the measurements to determine compliance. The expanded uncertainty values for the various scopes in the WLL accreditation are provided in Table 2 below.

Table 2: Expanded Uncertainty List

Scope	Standard(s)	Expanded Uncertainty
Conducted Emissions	CISPR11, CISPR22, CISPR14, FCC Part 15	2.63 dB
Radiated Emissions	CISPR11, CISPR22, CISPR14, FCC Part 15	4.55 dB

3 Test Equipment

15.207	RSS-Gen [7.2.2]	AC Conducted Emissions	NA
15.209	RSS-210 sect 2.5	General Field Strength Limits	Pass

5 Test Results

5.1 Duty Cycle Correction and Time of Occupancy

In accordance with the FCC Public Notice the average spurious radiated emissions measurements may be further adjusted using a duty cycle correction factor if the dwell time per channel of the hopping signal is less than 100 ms.

The duty cycle correction factor is calculated by:

$$20 \times \text{LOG} (\text{dwell time}/100 \text{ ms})$$

The following figure shows the plot of the dwell time for the transmitter. Based on this plot, the dwell time per hop is 19.5ms. The maximum total dwell time per 100ms is 38ms. This corresponds to a duty cycle correction of -8.1dB for radiated spurious emissions.

The transmitter shall have a time of occupancy for systems having a 20dB bandwidth greater than 250 kHz of no more than 0.4seconds in any 10 second period.

These tests were conducted with the RF output connected through appropriate attenuators to the input of a spectrum analyzer set to zero span mode. The unit was set to hopping mode with the spectrum analyzer set to 902.75MHz. The results are shown in the plots below.

Table 5: Duty Cycle/time of Occupancy Results

Test	Result	Limit	Pass/Fail
Dwell time per Hop	19.5ms	NA	NA
Dwell time per 100ms	39ms	NA	NA
Time of Occupancy	195ms	0.4 sec per 10 sec	Pass

Figure 1: Single Hop Duty Cycle Plot

Cooper Power Systems, RFN420A3 Module, 915MHz Radio, FCC pt15.247/ESS210 Duty cycle per 100ms (worst case)
This Plot used for additional Duty cycle correction of $20\text{Log}([\text{dwell time per } 100\text{ms}]/100\text{ms})$
 $20\text{Log}([\text{dwell time per } 100\text{ms}]/100\text{ms}) = 29\text{ms}[2 \text{ pulses of } 19.5\text{ms}]/100\text{ms} = 20\text{Log}(0.39) = -8.1\text{dBm}$
Agilent 08:44:40 Jul 27, 2011 R T

Figure 2: Dwell time per 100ms

Cooper Power Systems, RFN420A3 Module, 915MHz Radio, FCC pt15.247/RS\$210 Time of Occupancy per 10Seconds
Limit= 0.4Seconds per 10 seconds for bandwidths greater than 250kHz
Measured= 19.5ms per hop (from dwell time plot) * 10hops = 195ms per 10 seconds

Figure 3: Time of Occupancy
(Highest spikes are the hop channel, lower spikes are adjacent channels)

5.2 RF Power Output: (FCC Part §2.1046)

To measure the output power the hopping sequence was stopped while the frequency dwelled on a low, high and Center channel. The output from the transmitter was connected to an attenuator and then to the input of the RF Spectrum Analyzer. The analyzer offset was adjusted to compensate for the attenuator and other losses in the system. The EUT has an adjustable output range. The highest and lowest power available is shown below.

Table 6: RF Power Output

Frequency	Power Setting	Level (dBm)	Limit (dBm)	Pass/Fail
Low Channel: 902.75MHz	High	26.74	30	Pass
Center Channel: 914.75MHz	High	27.21	30	Pass
High Channel: 927.25MHz	High	27.90	30	Pass
Low Channel: 902.75MHz	Low	-30.51	30	Pass
Center Channel: 914.75MHz	Low	-30.35	30	Pass
High Channel: 927.25MHz	Low	-30.34	30	Pass

Figure 4: RF Peak Power, High Power, Low Channel

Figure 5: RF Peak Power, High Power, Center Channel

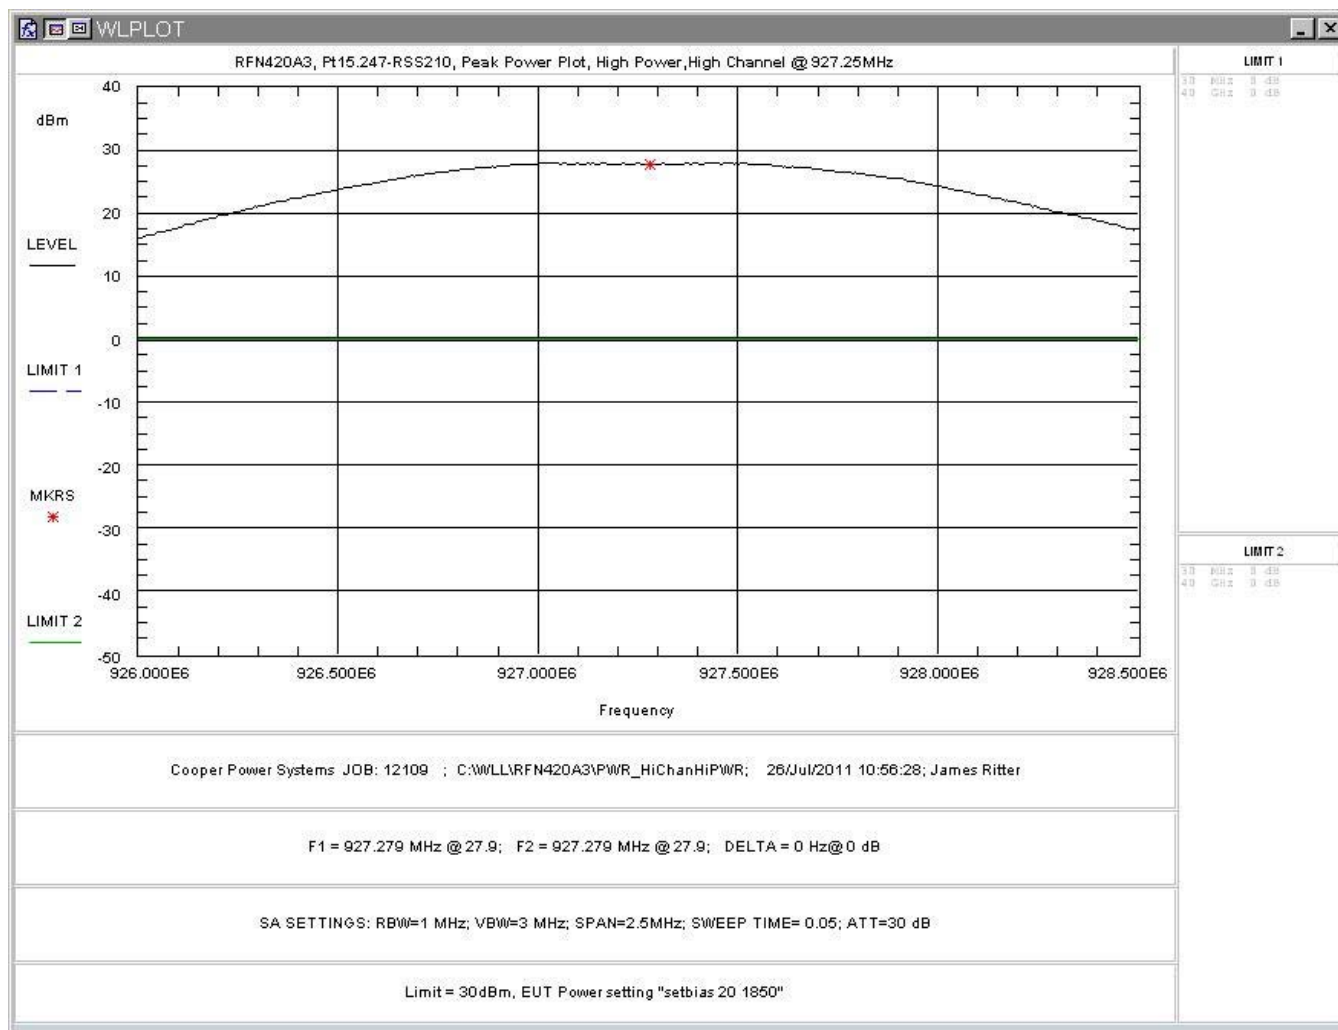

Figure 6: RF Peak Power, High Power, High Channel

Figure 7: RF Peak Power, Low Power, Low Channel

Figure 8: RF Peak Power, Low Power, Center Channel

Figure 9: RF Peak Power, Low Power, High Channel

5.3 Occupied Bandwidth: (FCC Part §2.1049)

Occupied bandwidth was performed by coupling the output of the EUT to the input of a spectrum analyzer.

For Frequency Hopping Spread Spectrum Systems, FCC Part 15.247 requires the maximum 20 dB bandwidth not exceed 500kHz.

At full modulation, the occupied bandwidth was measured as shown:

Table 7 provides a summary of the Occupied Bandwidth Results.

Table 7: Occupied Bandwidth Results

Frequency	Bandwidth (kHz)	Limit (kHz)	Pass/Fail
Low Channel: 902.75MHz	481.31	500	Pass
Center Channel: 914.75MHz	491.58	500	Pass
High Channel: 927.25MHz	485.89	500	Pass

Figure 10: Occupied Bandwidth, Low Channel

Figure 11: Occupied Bandwidth, Center Channel

Figure 12: Occupied Bandwidth, High Channel

5.4 Channel Spacing and Number of Hop Channels (FCC Part §15247(a)(1))

Per the FCC requirements, frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25kHz or the 20 dB bandwidth, whichever is greater. The maximum 20dB bandwidth measured is 491.6kHz so the channel spacing must be more than 491.6kHz. In addition, for a 902-928MHz transmitter with an occupied bandwidth greater than 250kHz the minimum number of hopping channels shall be 25.

The EUT antenna was removed and the cable was connected directly into a spectrum analyzer through a 20 dB attenuator. An offset was programmed into the spectrum analyzer to compensate for the loss of the external attenuator. The spectrum analyzer resolution bandwidth was set to 30 kHz and the video bandwidth was set to 100 kHz. The channel spacing of 2 adjacent channels was measured using a spectrum analyzer span setting of 100kHz. Also, the number of hopping channels was measured from 902-928MHz using a RBW/VBW setting of 30kHz.

The following are plots of the channel spacing and number of hopping channels data. The channel spacing was measured to be 500kHz and the number of channels used is 50.

Note: in the following plots each channel is composed of 2 distinct peaks.

Table 8: Channel Spacing and Number of Channels Results

Frequency	Result	Limit	Pass/Fail
Channel Spacing	500kHz	484.5kHz minimum	Pass
Number of channels	50 channels	25 channels minimum	Pass

Figure 13: Channel Spacing

Figure 14: Number of Hopping Channels

5.5 Conducted Spurious Emissions at Antenna Terminals (FCC Part §2.1051)

The EUT must comply with requirements for spurious emissions at antenna terminals. Per §15.247(c) all spurious emissions in any 100 kHz bandwidth outside the frequency band in which the spread spectrum device is operating shall be attenuated 20 dB below the highest power level in a 100 kHz bandwidth within the band containing the highest level of the desired power.

The EUT antenna was removed and the cable was connected directly into a spectrum analyzer through a 10 dB attenuator. An offset was programmed into the spectrum analyzer to compensate for the loss of the external attenuator. The spectrum analyzer resolution bandwidth was set to 100 kHz and the video bandwidth was set to 100 kHz. The amplitude of the EUT carrier frequency was measured to determine the emissions limit (20 dB below the carrier frequency amplitude). The emissions outside of the allocated frequency band were then scanned from 30 MHz up to the tenth harmonic of the carrier.

The following are plots of the conducted spurious emissions data.

Figure 15: Conducted Spurious Emissions, High Power, Low Channel 30 - 900MHz
