1. Summary of test results

The test results apply exclusively to the test samples as presented in this report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according FCC: §2.927 to §2.948 & ISED: RSP-100, Issue 11, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The presented Equipment Under Test (in this report, hereinafter referred as EUT) integrates a Tire Pressure Monitoring System Radio Transmitter working at 314.98 MHz for data monitoring and emergency cases.

Following test cases have been performed to show compliance with valid Part 15.205/15.209/15.231 (e) of the FCC CFR Title 47 Rules, Edition 4th November 2016 & ISED RSS-210 Issue 9/ RSS-Gen Issue 4 standards.

1.1. Tests overview of US (FCC) and Canada ISED(RSS) Standards

☒	No deviations from the technical specifications were ascertained
☐	There were deviations from the technical specifications ascertained
☐	This test report is only a partial test report. The content and verdict of the performed test cases are listed below.

Test Specification Clause	Test Case	Temperature Conditions	Power Source Voltages	C	NC	NA	NP	Remark

4. Description of test system set-up's

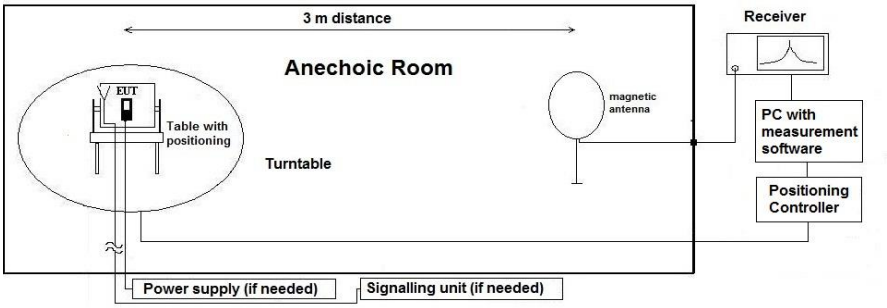
4.1. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification: ANSI C63.10-2013 chapter 6.4 (§6.4.4.2)

General Description: Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Schematic:



Testing method:

Exploratory, preliminary measurement
The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0°to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$

$M = L_T - E_C$

AF =Antenna factor
C_L = Cable loss
D_F= Distance correction factor
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A= Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

All units are dB-units, positive margin means value is below limit.

Distance correction:

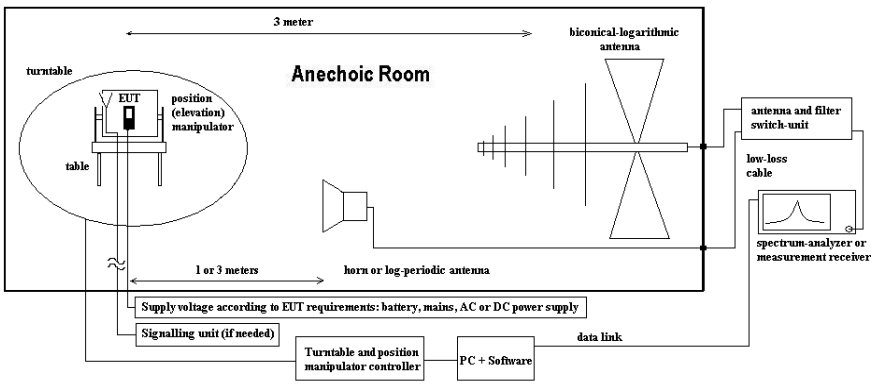
Reference for applied correction (extrapolating) factors due to reduced measurement distance:
ANSI C63.10:2013, §6.4.4.2 - Equations (2) + (3) + (4)

4.2 Test system set-up for radiated electric field measurement 30 MHz to 1 GHz

Specification: ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description: Evaluating the field emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the regulatory commissions.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semi-anechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
E_C = Electrical field – corrected value
E_R = Receiver reading
G_A = Gain of pre-amplifier (if used)
L_T = Limit
M = Margin

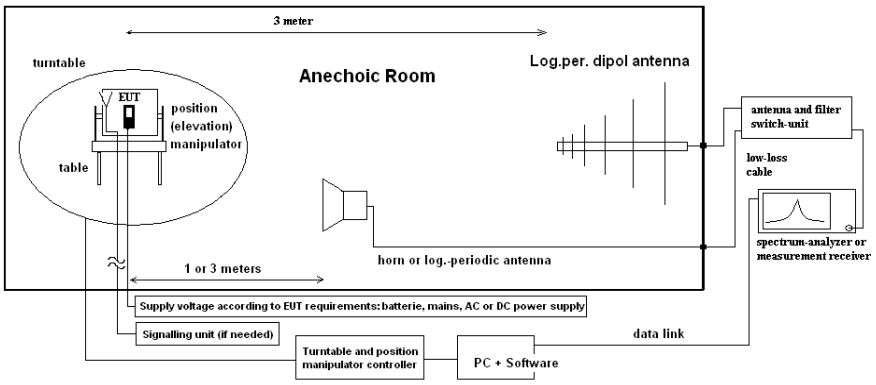
All units are dB-units, positive margin means value is below limit.

4.3 Test system set-up for radiated electric field measurement above 1 GHz

Specification: ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

General Description: Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

Schematic:



Testing method:

Exploratory, preliminary measurements
The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 15°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2-orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMI-receiver, broadband antenna and software.
The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies
Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:

$E_C = E_R + AF + C_L + D_F - G_A$ (1)

$M = L_T - E_C$ (2)

E_C = Electrical field – corrected value
E_R = Receiver reading
M = Margin
L_T = Limit
AF = Antenna factor
C_L = Cable loss
D_F = Distance correction factor (if used)
G_A = Gain of pre-amplifier (if used)

All units are dB-units, positive margin means value is below limit.

ISED	☒ RSS-210, Issue 9. A.1.4 (b)
ANSI	☒ C63.10-2013 Chapter 7.5

5.1.3. Limit

☒ **FCC**

§15.231 (e) - In addition, devices operated under the provisions of this paragraph shall be provided with a means for automatically limiting operation so that the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.
Unless otherwise specified, e.g. Section 15.255(b), when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. As an alternative (provided the transmitter operates for longer than 0.1 seconds) or in cases where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval during which the field strength is at its maximum value. The exact method of calculating the average field strength shall be submitted with any application for certification or shall be retained in the measurement data file for equipment subject to notification or verification.

☒ **ISED**

RSS-210 Issue 9 A.1.4 (b) - In addition, devices operated under the provisions of this section shall be capable of automatically limiting their operation so that the duration of each transmission is not greater than 1 second and the silent period between transmissions is at least 30 times the duration of the transmission, but not less than 10 seconds under any circumstances. However, devices that are designed for limited use for the purpose of initial programming, reprogramming or installing, and not for regular operations, may operate for up to 5 seconds, provided such devices are used only occasionally in connection with each unit being programmed or installed.

RSS-Gen Issue 4 Section 6.10 - When the field strength (or envelope power) is not constant or it is in pulses, and an average detector is specified to be used, the value of field strength or power shall be determined by averaging over one complete pulse train, including blanking intervals within the pulse train, as long as the pulse train does not exceed 0.1 second. In cases where the pulse train exceeds 0.1 second, the average value of field strength or output power shall be determined during a 0.1 second interval during which the field strength or power is at its maximum value.

5.1.4. EUT settings:

For pulsed device, set sample work at normal condition for timing of the transmitter and silent periods between transmissions measurement;

5.1.5. Measurement method:

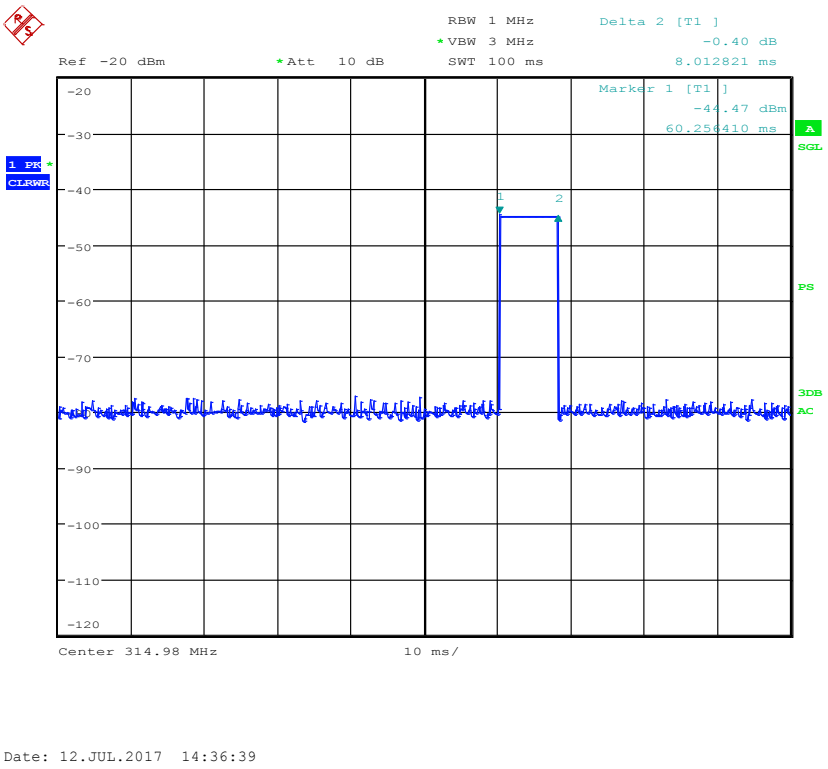
The measurement was performed in normal transmission mode with the carrier set to only one channel.

5.1.6. Settings on Spectrum-Analyzer:

Center Frequency	314.98 MHz
Span	0 MHz
Resolution Bandwidth (RBW)	1 MHz
Video Bandwidth (VBW)	3 MHz
Sweep time	100 ms
Detector	Peak
Trace Mode	Single sweep

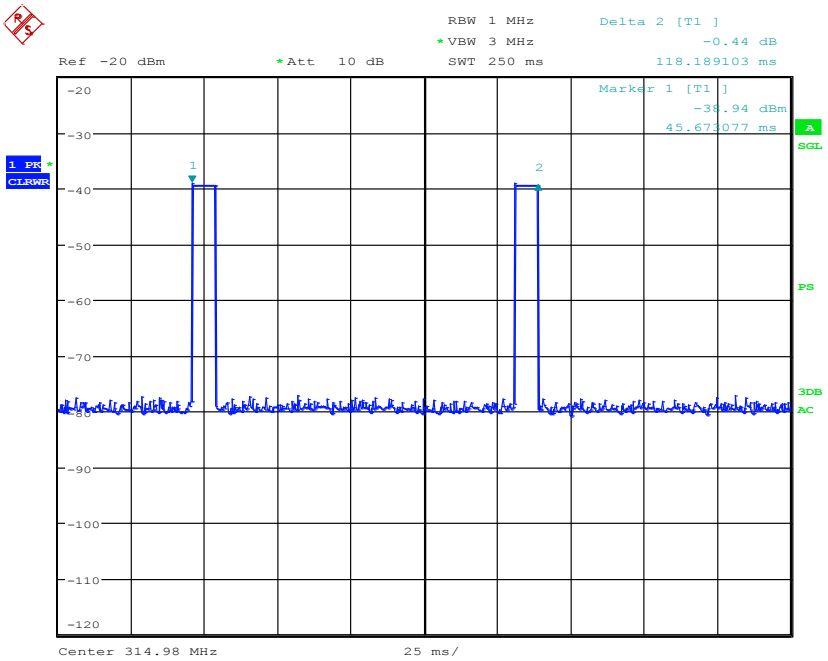
5.1.7. Measurement Results

Plot 1: One transmit burst



Burst length within 100 ms: 8.01 ms
Burst duty cycle: 8.01/100*100% = 8.01%
Burst transmission duration average correction factor: 20 log (0.0801) = -21.93 dB

Plot 2: TX on time (complete pulse train which is always followed by a silent period)



Verdict: Timing diagrams shows timing as shown in documentation

5.1.8. Timings according technical description “TPMS_Technical_Document（PMV-E000）_FCC”

5.1.8.1. Rotating mode 1

1 burst within 100 ms = 8.01 % correction factor: 20 log (0.0801) = -21.93 dB accord. §15.35 (c)
2 burst within 16 s period

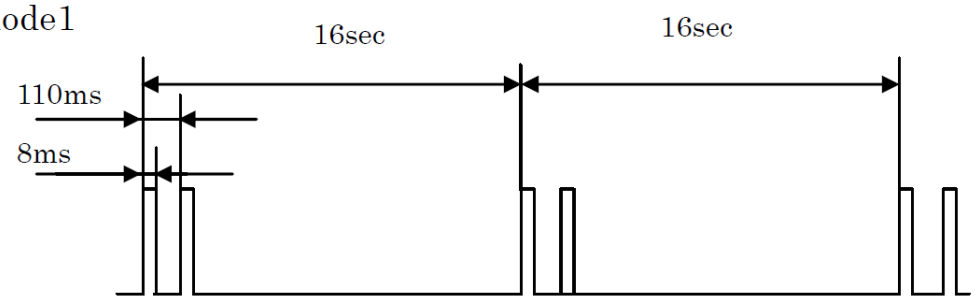
Minimum silent period: 16 s – 110 ms - 8ms = 15.81 s

Limit:

TX-on: Consecutive bursts (including TX-off times) are considered one transmission as to complete a message:
2 bursts x 8ms + 102ms = 102.16 ms
☒ < 1 s

TX-off:
☐ > 30 times of the transmission
☒ > 10 s

☐Rotating mode1



Verdict: Pass according §15.231(e)

5.1.8.2. Rotating mode 2

1 burst within 100 ms = 8.01 % correction factor: 20 log (0.0801) = -21.93 dB
3 burst (4bursts) within 48 s period

Minimum silent period for 3 bursts: 48 s – 110*2 ms – 8 ms = 47.7 s
Minimum silent period for 4 bursts: 48 s – 110*3 ms – 8 ms = 47.59 s

Limit:

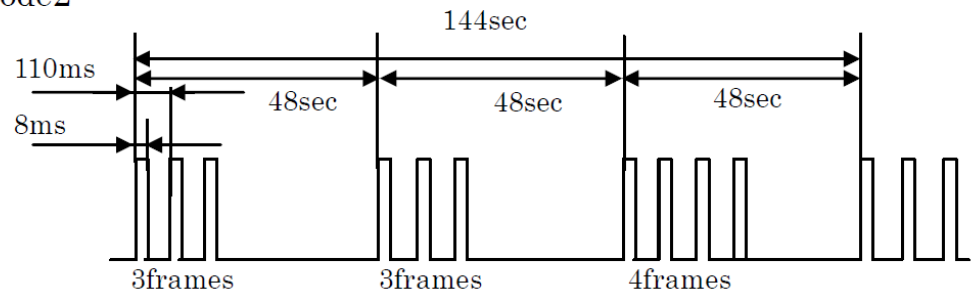
TX-on for 3 bursts message: Consecutive bursts (including TX-off times) are considered one transmission as to complete a message: 3 bursts x 8ms + 2* 102ms = 228 ms

TX-on for 4 bursts message: Consecutive bursts (including TX-off times) are considered one transmission as to complete a message: 4 bursts x 8ms + 3* 102ms = 338 ms

☒ < 1 s

TX-off:
☐ > 30 times of the transmission
☒ > 10 s

☐Rotating mode2



Verdict: Pass according §15.231(e)

5.1.8.3. Stationary mode:

1 burst within 0.1 s = 8.01 % correction factor: 20 log (0.0801) = -21.93 dB

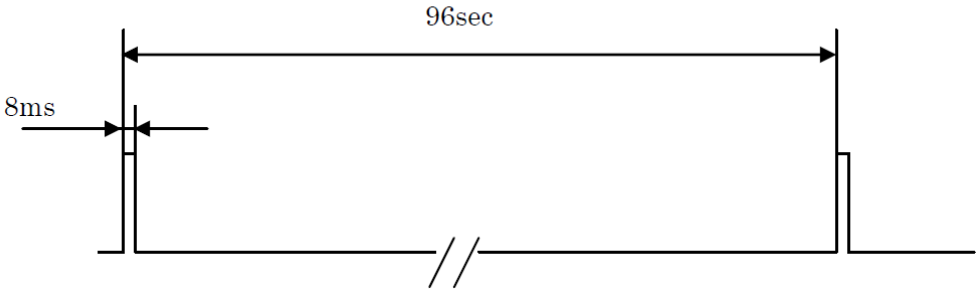
Minimum silent period: 96 s – 8 ms = 95.92 s

Limit §15.231(e):

TX-on: 1 bursts x 8ms = 8ms
☒ < 1 s

TX-off:
☐ > 30 times of the transmission
☒ > 10 s

☐Stationary mode

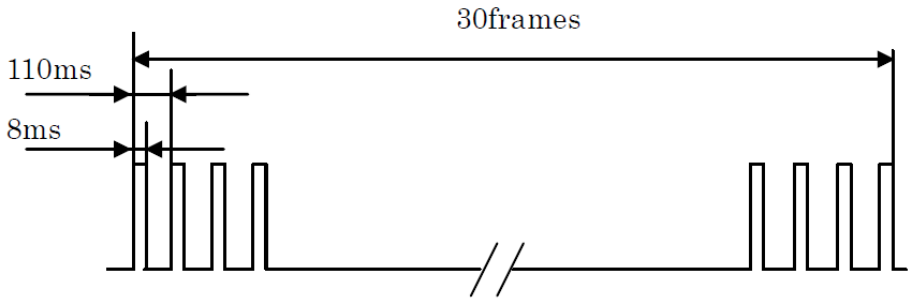


Verdict: Pass according §15.231(e)

5.1.8.4. Pressure alert:

Extract from technical document:

☐Pressure alert



30 Frames consisting of 30 transmitting bursts with a TX-on time of 8ms. Consecutive bursts are considered one transmission (including TX-off times) as to complete an alarm message.

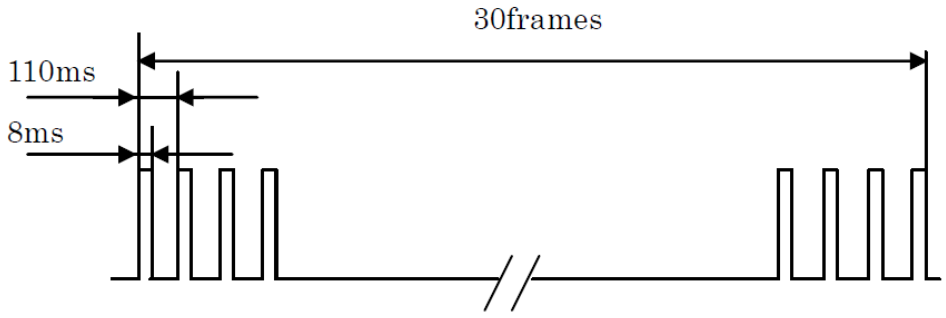
TX-on time: 30 Frames repeating each 110ms = 3.3 seconds total transmit time< 5 seconds
Limit according §15.231(a)(2): *A transmitter activated automatically shall cease transmission within 5 seconds after activation*

Verdict: Pass according §15.231(a)(2)

5.1.8.5. High temperature alert:

Extract from technical document:

☐High temperature alert



30 Frames consisting of 30 transmitting bursts with a TX-on time of 8ms. Consecutive bursts are considered one transmission (including TX-off times) as to complete an alarm message.

TX-on time: 30 Frames repeating each 110ms = 3.3 seconds total transmit time< 5 seconds

Limit according §15.231(a)(2): *A transmitter activated automatically shall cease transmission within 5 seconds after activation*

Verdict: Pass according §15.231(a)(2)

FCC	☒ 2.1049(h) ☒ FCC 2.202 for information
ISED	☒ RSS-Gen, Issue4 , Chapter 6.6
Remark	The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

5.2.3. Limit

☒ **FCC**

§15.231 (c) - The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier.

☒ **ISED**

RSS-210 Issue 9 A.1.3 - The 99% bandwidth of momentarily operated devices shall be less or equal to 0.25% of the centre frequency for devices operating between 70 MHz and 900 MHz. For devices operating above 900 MHz, the 99% bandwidth shall be less or equal to 0.5% of the centre frequency.

FCC	ISED
≤787.45 KHz	≤787.45 KHz

5.2.4 EUT settings

For pulsed device, set sample work at engineer condition (continue transmit) and with modulated signal for 99% occupied bandwidth measurement;

5.2.5 Measurement method

The measurement was performed with the RBW set to 10 KHz. The span was set to cover the complete carrier. The carrier frequency was used for showing the compliance with this requirement. A 99% OBW measurement function was used to measure the bandwidth compared 99% of the highest In-Band power. The operating modes have been varied.

5.2.6 Spectrum-Analyzer Settings

Center Frequency	314.98 MHz
Span	1 MHz
Resolution Bandwidth (RBW)	1 % of the span (10 kHz)
Video Bandwidth (VBW)	3 x RBW (30 kHz)

☒ **ISED**

RSS-210 Issue 9 A.1.4 (a) - Devices may not meet the requirements in Section A.1.1 and may be employed for any type of operation, provided the device complies with the requirements of Section A.1.3 and the field strength corresponds with the limits specified in Table A2.

The field strength limits shown in Table A2 are based on the average value of the measured emissions. As an alternative, compliance with the limits in this table may be based on the use of measurement instruments with an International Special Committee on Radio Interference (CISPR) quasi-peak detector.

Table A2— Reduced Field Strength Limits for Momentarily Operated Devices

Frequency (MHz), Excluding Restricted Band Frequencies of RSS-Gen (See Note 1 above)	Field Strength of the Fundamental (µV/m at 3 m)
70-130	500
130-174	500 to 1,500*
174-260	1,500
260-470	1,500 to 5,000*
Above 470	5,000
314.98 [Fundamental Frequency]	**2416.33 [67.66 dBuV/m]**

* Linear interpolation with frequency, f, in MHz:

For 130-174 MHz: Field Strength (µV/m) = (22.73 x f)-2454.55
For 260-470 MHz: Field Strength (µV/m) = (16.67 x f)-2833.33

5.5.2. Requirements/Limits

☒ **FCC**

§15.231(e) - Intentional radiators may operate at a periodic rate exceeding that specified in paragraph (a) of this section and may be employed for any type of operation, including operation prohibited in paragraph (a) of this section, provided the intentional radiator complies with the provisions of paragraphs (b) through (d) of this section, except the field strength table in paragraph (b) of this section is replaced by the following:

Fundamental frequency (MHz)	Field strength of fundamental (microvolts/meter)	Field strength of spurious emission (microvolts/meter)	Measurement distance (m)
40.66-40.70	1,000	100	3
70-130	500	50	3
130-174	500 to 1,500[1]	50 to 150[1]	3
174-260	1,500	150	3
260-470	1,500 to 5,000[1]	150 to 500[1]	3
Above 470	5,000	500	3

[1]Linear interpolations.

§15.231(b) - Intentional radiators operating under the provisions of this section shall demonstrate compliance with the limits on the field strength of emissions, as shown in the above table, based on the average value of the measured emissions. As an alternative, compliance with the limits in the above table may be based on the use of measurement instrumentation with a CISPR quasi-peak detector. The specific method of measurement employed shall be specified in the application for equipment authorization. If average emission measurements are employed, the provisions in §15.35 for averaging pulsed emissions and for limiting peak emissions apply. Further, compliance with the provisions of §15.205 shall be demonstrated using the measurement instrumentation specified in that section.

Frequency (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	67.60 – 20log(F)	300
0.490-1.705	24000/F(kHz)	87.60 – 20log(F)	30
1.705-30.0	30	29.54	30
30-88	100**	30.00	3
88-216	150**	43.50	3
216-960	200**	46.00	3
Above 960	500	54.00	3

**Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this part, e.g., §§15.231 and 15.241.

☒ **ISED**

RSS-Gen Issue 9 A.1.4 (d) - Unwanted emissions shall comply with the general field strength limits specified in RSS-Gen or 10 times below the fundamental emissions field strength limit in Table A2, whichever is less stringent.

Frequency (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	67.60 – 20log(F)	300
0.490-1.705	24000/F(kHz)	87.60 – 20log(F)	30
1.705-30.0	30	29.54	30
30-88	100**	30.00	3
88-216	150**	43.50	3
216-960	200**	46.00	3
Above 960	500	54.00	3

Note: The emission limits for the bands 9-90 kHz and 110-490 kHz are based on measurements employing a linear average detector. Transmitting devices are not permitted in restricted frequency bands unless stated otherwise in the relevant RSS.

Unless otherwise specified, for all frequencies greater than 1 GHz, the radiated emission limits for licence-exempt radio apparatus stated in applicable RSSs (including RSS-Gen) are based on measurements using a linear average detector function having a minimum resolution bandwidth of 1 MHz. If an average limit is specified for the EUT, then the peak emission shall also be measured with instrumentation properly adjusted for such factors as pulse desensitization to ensure the peak emission is less than 20 dB above the average limit.

5.5.3. Restricted bands of operation (FCC §15.205/ RSS-Gen. Issue 4 Chapter 8.9. Table 4)

[1]Linear interpolations.

§15.231(b) - Intentional radiators operating under the provisions of this section shall demonstrate compliance with the limits on the field strength of emissions, as shown in the above table, based on the average value of the measured emissions. As an alternative, compliance with the limits in the above table may be based on the use of measurement instrumentation with a CISPR quasi-peak detector. The specific method of measurement employed shall be specified in the application for equipment authorization. If average emission measurements are employed, the provisions in §15.35 for averaging pulsed emissions and for limiting peak emissions apply. Further, compliance with the provisions of §15.205 shall be demonstrated using the measurement instrumentation specified in that section.

Frequency (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	67.60 – 20log(F)	300
0.490-1.705	24000/F(kHz)	87.60 – 20log(F)	30
1.705-30.0	30	29.54	30
30-88	100**	30.00	3
88-216	150**	43.50	3
216-960	200**	46.00	3
Above 960	500	54.00	3

**Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz or 470-806 MHz. However, operation within these frequency bands is permitted under other sections of this part, e.g., §§15.231 and 15.241.

☒ **ISED**

RSS-Gen Issue 9 A.1.4 (d) - Unwanted emissions shall comply with the general field strength limits specified in RSS-Gen or 10 times below the fundamental emissions field strength limit in Table A2, whichever is less stringent.

Frequency (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	67.60 – 20log(F)	300
0.490-1.705	24000/F(kHz)	87.60 – 20log(F)	30
1.705-30.0	30	29.54	30
30-88	100**	30.00	3
88-216	150**	43.50	3
216-960	200**	46.00	3
Above 960	500	54.00	3

Note: The emission limits for the bands 9-90 kHz and 110-490 kHz are based on measurements employing a linear average detector. Transmitting devices are not permitted in restricted frequency bands unless stated otherwise in the relevant RSS.

Unless otherwise specified, for all frequencies greater than 1 GHz, the radiated emission limits for licence-exempt radio apparatus stated in applicable RSSs (including RSS-Gen) are based on measurements using a linear average detector function having a minimum resolution bandwidth of 1 MHz. If an average limit is specified for the EUT, then the peak emission shall also be measured with instrumentation properly adjusted for such factors as pulse desensitization to ensure the peak emission is less than 20 dB above the average limit.

5.5.3 Restricted bands of operation (FCC §15.205/ RSS-Gen. Issue 4 Chapter 8.9. Table 4)

MHz	MHz	MHz	GHz
0.090-0.110	16.42-16.423	399.9-410	4.5-5.15
0.495-0.505	16.69475-16.69525	608-614	5.35-5.46
2.1735-2.1905	16.80425-16.80475	960-1240	7.25-7.75
4.125-4.128	25.5-25.67	1300-1427	8.025-8.5
4.20725-4.20775	37.5-38.25	1645.5-1646.5	9.3-9.5
6.215-6.218	73-74.6	1660-1710	10.6-12.7
6.26775-6.26825	74.8-75.2	1718.8-1722.2	13.25-13.4

Remark:
* is Harmonics of spurious;
Average Values = Peak values + Duty Cycle Factor for Harmonics of spurious;

5.7. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**. such that a confidence level of approximately 95% is achieved.
For uncertainty determination. each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Calculated uncertainty based on a confidence level of 95%						Remarks
Conducted emissions (U_{CISPR})	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz	4.0 dB 3.6 dB						-
Radiated emissions Enclosure	CISPR 16-2-3	30 MHz - 1 GHz 1 GHz - 18 GHz	4.2 dB 5.1 dB						E-Field
Disturbance power	CISPR 16-2-2	30 MHz - 300 MHz	-						-
Power Output radiated	-	30 MHz - 4 GHz	3.17 dB						Substitution method
Power Output conducted	-	Set-up No.	Cel-C1	Cel-C2	BT1	W1	W2	--	
		9 kHz - 12.75 GHz	N/A	0.60	0.7	0.25	N/A	--	-
		12.75 - 26.5GHz	N/A	0.82	--	N/A	N/A	--

Radiated emissions Enclosure	-	150 kHz - 30 MHz 30 MHz - 1 GHz 1 GHz - 20 GHz	5.0 dB 4.2 dB 3.17 dB						Magnetic field E-field Substitution

Table: measurement uncertainties. valid for conducted/radiated measurements

6. Abbreviations used in this report

The abbreviations	
ANSI	American National Standards Institute
AV . AVG. CAV	Average detector
EIRP	Equivalent isotropically radiated power. determined within a separate measurement
EGPRS	Enhanced General Packet Radio Service
EUT	Equipment Under Test
FCC	Federal Communications Commission. USA
IC	Industry Canada
n.a.	not applicable
Op-Mode	Operating mode of the equipment
PK	Peak
RBW	resolution bandwidth
RF	Radio frequency
RSS	Radio Standards Specification. Dokuments from Industry Canada
Rx	Receiver
TCH	Traffic channel
Tx	Transmitter
QP	Quasi peak detector
VBW	Video bandwidth
ERP	Effective radiated power

8.1.3. Legend

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (Ref.-No. 442)
	1b	System-CTC-EMS-Conducted (Ref.-No. 335)
	1c	System CTC-FAR-EMI-RSE (Ref.-No . 443)
	1d	System CTC-SAR-EMI (Ref.-No . 441)
	1e	System CTC-OATS (EMI radiated) (Ref.-No. 337)
	1 f	System CTC-CTIA-OTA (Ref.-No . 420)
	1 g	System CTC-FAR-EMS (Ref.-No . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months. between this every 12 months internal validation
	36/12 M	Calibration every 36 months. between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration

9. Versions of test reports (change history)

Version	Applied changes	Date of release
