

TESTING CERT #3478.01

TEST REPORT

EUT Description	1x1 802.11ac + BT 4.2 combo, PCIe M.2 2230 adapter card
Brand Name	Intel® Dual-Band Wireless-AC 3168
Model Name	3168NGW
Serial Number	TA#: H84692-006 WF MAC: 34.13.E8.4F.11.FE BT MAC: 34.13.E8.4F.12.02 (see section 4)
FCC/IC ID	FCC ID: PD93168NG & PD93168NGU IC ID: 1000M-3168NG
Antenna type	SkyCross WIMAX/WLAN Reference Antenna Type PIFA
Hardware/Software Version	HW: TF1 – cfg 51.12 Test SW: DRTU version: 1.8.4-02304 Op SW: 99.0.17.7
Date of Sample Receipt	2016-01-07
Date of Test Start/End	2016-01-11 / 2016-01-20
Features	802.11 a/b/g/n/ac Wireless LAN + BDR/EDR 2.1 + BLE 4.2 (see section 7)

Applicant	Intel Mobile Communications
Address	100 Center Point Circle, Suite 200 / Columbia, SC 29210 / United States
Contact Person	Steven Hackett
Telephone/Fax/Email	steven.c.hackett@intel.com

Reference Standards	FCC 47 CFR Part §2.1093 RSS-102, Issue 5 (see section 1)	
RF Exposure Environment	Portable devices - General population/uncontrolled exposure	
	SAR Result	SAR Limit
Maximum SAR Result & Limit	0.77 W/kg (1g)	1.6 W/kg (1g)
Min. test separation distance	8mm	

Test Report number	160107-01.TR05
Revision Control	Rev. 00

The test results relate only to the samples tested.
The test report shall not be reproduced in full, without written approval of the laboratory.

2. General conditions, competences and guarantees

- ✓ Intel Mobile Communications Wireless RF Lab (Intel WRF Lab) is a testing laboratory accredited by the American Association for Laboratory Accreditation (A2LA).
- ✓ Intel Mobile Communications Wireless RF Lab (Intel WRF Lab) is an Accredited Test Firm listed by the FCC, with Designation Number FR0011.
- ✓ Intel Mobile Communications Wireless RF Lab (Intel WRF Lab) is a Registered Test Site listed by IC, with IC Assigned Code 1000Y.
- ✓ Test results and interpretations.
- ✓ Intel WRF Lab is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.
- ✓ Intel WRF Lab has developed calibration and proficiency programs for its measurement equipment to ensure correlated and reliable results to its customers.
- ✓ This report is only referred to the item that has undergone the test.
- ✓ This report does not imply an approval of the product by the Certification Bodies or competent Authorities.
- ✓ Complete or partial reproduction of the report cannot be made without written permission of Intel WRF Lab.

3. Environmental Conditions

- ✓ All tests were performed in a laboratory with an environment which avoids influence on SAR measurements by ambient EM sources and any reflection from the environment itself, and the following limits were not exceeded during the tests:

Temperature	22°C ± 2°C
Humidity	50% ± 15%
Liquid Temperature	22°C ± 2°C

4. Test samples

Sample	Test Item #	Description	Model	Serial #	Date of reception
#01	160107-01.S02	Wireless Module	3168NGW	WF MAC:34.13.E8.4F.11.FE BT MAC:34.13.E8.4F.12.02	2016-01-07
	15040201.S13	NGFF extender	PCDB00495	-	2015-01-07
	15040201.S15	Laptop PC	Latitude E5440	-	2015-01-07
	15081801.S14	PC Cable	Semtech		2015-01-07

- ✓ Sample #01 has undergone all the test(s) requested by the applicant, following the standards specified in section 1.

5. Remarks and comments

1. Only the plots for the test positions with the highest measured SAR per band/mode are included in *Annex C. Test System Plots*, as required per FCC OET KDB 865664 D02, paragraph 2.3.8.

6. Document Revision History

Revision #	Date	Modified by	Details
Rev. 00	2016-02-23	Cheiel In	First Issue

7. Equipment Under Test

Brand Name	Intel® Dual Band Wireless-AC 3168
Model Name	3168NGW
FCC/IC ID	FCC ID: PD93168NG & PD93168NGU IC ID: 1000M-3168NG
Software Version	1.8.4-02304
Driver Version	99.0.16.7
Prototype / Production	Engineering sample
Exposure Conditions	Body worn
Supported Radios	1x1 802.11a/b/g/n/ac BDR/EDR v2.1 - Bluetooth LE v4.2
Antenna Information	Main WLAN: PIFA antenna. WiFi 2.4GHz & 5GHz Aux WLAN: PIFA antenna. BT. <i>See Annex F - Photographs</i>
Simultaneous Transmission Configurations	WLAN 2.4GHz Main + BT Aux WLAN 5GHz Main + BT Aux
Additional Information	No WWAN transmitter is considered in this report
	5.60-5.65 GHz band (TDWR) is supported by the device
	Band gap is supported by the device

8. Test Verdicts summary

Mode	Band	Highest Reported SAR (1g) (W/kg)	Verdict
802.11b/g/n	2.4GHz	0.71	P
802.11a/n/ac	5.3GHz	0.77	P
	5.6GHz	0.56	P
	5.8GHz	0.40	P
Bluetooth	2.4GHz	0.08	P

P: Pass
 F: Fail
 NM: Not Measured
 NA: Not Applicable

According to the FCC OET KDB 690783 D01, this is the summary of the values for the Grant Listing:

Highest Reported SAR (1g) (W/kg)			
Exposure Condition	Equipment Class		
	DTS	DSS	NII
Body Worn	0.71	0.08	0.77
Simultaneous Tx	Sum-SAR: 0.77	Sum-SAR: 0.80	Sum-SAR: 0.80

Considering the results of the performed test according to FCC 47CFR Part 2.1093 and IC RSS 102, Issue 5 the item under test is IN COMPLIANCE with the requested specifications specified in section 1. *Standards, reference documents and applicable test methods.*

Annex A. Test & System Description

A.1 SAR Definition

Specific Absorption rate is defined as the time derivative of the incremental energy (dW) absorbed by (dissipated in) and incremental mass (dm) contained in a volume element (dV) of a given density (ρ).

$$SAR = \frac{d}{dt} \cdot \left(\frac{dW}{dm} \right) = \frac{d}{dt} \cdot \left(\frac{dW}{\rho \cdot dV} \right)$$

SAR is expressed in units of watts per kilogram (W/kg). SAR can be related to the electric field at a point by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where:

σ = Conductivity of the tissue (S/m)
 ρ = Mass density of the tissue (kg/m³)
E = RMS electric field strength (V/m)

A.2 SPEAG SAR Measurement System

A.2.1 SAR Measurement Setup

The DASY5 system for performing compliance tests consists of the following items:

- ✓ A standard high precision 6-axis robot (Stäubli TX/RX family) with controller, teach pendant and software. It includes an arm extension for accommodating the data acquisition electronics (DAE)
- ✓ An isotropic field probe optimized and calibrated for the targeted measurements.
- ✓ A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- ✓ The Electro-optical Converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. The EOC signal is transmitted to the measurement server.
- ✓ The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movements interrupts.
- ✓ The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- ✓ A computer running Win7 professional operating system and the DASY5 software.
- ✓ Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- ✓ The phantom, the device holder and other accessories according to the targeted measurement.
- ✓ Tissue simulating liquid.
- ✓ System Validation dipoles.
- ✓ Network emulator or RF test tool

A.2.2 E-Field Measurement Probe

The probe is constructed using three orthogonal dipole sensors arranged on an interlocking, triangular prism core. The probe has built-in shielding against static charges and is contained within a PEEK cylindrical enclosure material at the tip.

The probe's characteristics are:

Frequency Range	30MHz – 6GHz
Length	337 mm
Probe tip external diameter	2.5 mm
Typical distance between dipoles and the probe tip	1 mm
Axial Isotropy (in human-equivalent liquids)	±0.3 dB
Hemispherical Isotropy (in human-equivalent liquids)	±0.5 dB
Linearity	±0.2 dB
Maximum operating SAR	100 W/kg
Lower SAR detection threshold	0.001 W/kg

A.2.3 SAM Phantom

The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528 and IEC 62209-1. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot.

The phantom's characteristics are:

Material	Vinylester, glass fiber reinforced (VE-GF)
Shell thickness	2 mm ± 0.2 mm
Shell thickness at ERP	6 ± 0.2 mm
Filling volume	25 Liters
Dimensions	Length: 1000mm / Width: 500mm

A.2.4 Flat Phantom

Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles.

The phantom's characteristics are:

Material	Vinylester, glass fiber reinforced (VE-GF)
Shell thickness	2 mm ± 0.2 mm
Filling volume	30 Liters approx.
Dimensions	Major axis: 600mm / Minor axis: 400mm

A.2.5 Device Positioner

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5 mm distance, a positioning uncertainty of 0.5 mm would produce a SAR uncertainty of 20%. Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation center for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles.

The DASY device holder is constructed of low-loss POM material having the following dielectric parameters: relative permittivity $\epsilon=3$ and loss tangent $\delta=0.02$. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

A simple but effective and easy-to-use extension for the Mounting Device; facilitates testing of larger devices according to IEC 62209-2 (e.g., laptops, cameras, etc.); lightweight and fits easily on the upper part of the Mounting Device in place of the phone positioner. The extension is fully compatible with the Twin SAM, ELI and other Flat Phantoms.

A.3 Data Evaluation

- **Power Reference measurement**

The robot measures the E field in a specified reference position that can be either the selected section's grid reference point or a user point in this section at 4mm of the inner surface of the phantom, 2mm for frequencies above 3GHz.

- **Area Scan**

Measurement procedures for evaluating SAR from wireless handsets typically start with a coarse measurement grid to determine the approximate location of the local peak SAR values. This is known as the area-scan procedure. The SAR distribution is scanned along the inside surface of one side of the phantom head, at least for an area larger than the projection of the handset and antenna. An example grid is shown in Figure 11. The distance between the measured points and phantom surface should be less than 8 mm, and should remain constant (with variation less than ± 1 mm) during the entire scan in order to determine the locations of the local peak SAR with sufficient accuracy. The angle between the probe axis and the surface normal line is recommended but not required to be less than 30° . If this angle is larger than 30° and the closest point on the probe-tip housing to the phantom surface is closer than a probe diameter, the boundary effect may become larger and polarization dependent. This additional uncertainty needs to be analyzed and accounted for. To achieve this, modified test procedures and additional uncertainty analyses not described in this recommended practice may be required. The measurement and interpolation point spacing should be chosen such as to allow identification of the local peak locations to within one-half of the linear dimension of a side of the zoom-scan volume. Because a local peak having specific amplitude and steep gradients may produce a lower peak spatial-average SAR compared to peaks with slightly lower amplitude and less steep gradients, it is necessary to evaluate these other peaks as well. However, since the spatial gradients of local SAR peaks are a function of the wavelength inside the tissue-equivalent liquid and the incident magnetic field strength, it is not necessary to evaluate local peaks that are less than 2 dB or more below the global maximum peak. Two-dimensional spline algorithms (Brishoual et al. 2001; Press et al., 1996) are typically used to determine the peaks and gradients within the scanned area. If a peak is found at a distance from the scan border of less than one-half the edge dimension of the desired 1 g or 10 g cube, the measurement area should be enlarged if possible.

- **Zoom Scan**

To evaluate the peak spatial-average SAR values for 1 g or 10 g cubes, fine resolution volume scans, called zoom scans, are performed at the peak SAR locations identified during the area scan. The minimum zoom scan volume size should extend at least 1.5 times the edge dimension of a 1 g cube in all directions from the center of the scan volume, for both 1 g and 10 g peak spatial-average SAR evaluations. Along the phantom curved surfaces, the front face of the volume facing the tissue/liquid interface conforms to the curved boundary, to ensure that all SAR peaks are captured. The back face should be equally distorted to maintain the correct averaging mass. The flatness and orientation of the four side faces are unchanged from that of a cube whose orientation is within $\pm 30^\circ$ of the line normal to the phantom at the center of the cube face next to the phantom surface. The peak local SAR locations that were determined in the area scan (interpolated values) should be used for the centers of the zoom scans. If a scan volume cannot be centered due to proximity of a phantom shape feature, the probe should be tilted to allow scan volume enlargement. If probe tilt is not feasible, the zoom-scan origin may be shifted, but not by more than half of the 1 g or 10 g cube edge dimension.

After the zoom-scan measurement, extrapolations from the closest measured points to the surface, for example along lines parallel to the zoom-scan centerline, and interpolations to a finer resolution between all measured and extrapolated points are performed. Extrapolation algorithm considerations are described in 6.5.3, and 3-D spline methods (Brishoual et al., 2001; Kreyszig, 1983; Press et al., 1996) can be used for interpolation. The peak spatial-average SAR is finally determined by a numerical averaging of the local SAR values in the interpolation grid, using for example a trapezoidal algorithm for the integration (averaging).

In some areas of the phantom, such as the jaw and upper head regions, the angle of the probe with respect to the line normal to the surface may be relatively large, e.g., greater than $\pm 30^\circ$, which could increase the boundary effect error to a larger level. In these cases, during the zoom scan a change in the orientation of the probe, the phantom, or both is recommended but not required for the duration of

the zoom scan, so that the angle between the probe axis and the line normal to the surface is within 30° for all measurement points.

- **Power Drift measurement**

The robot re-measures the E-Field in the same reference location measured at the Power Reference. The drift measurement gives the field difference in dB from the first to the last reference reading. This allows a user to monitor the power drift of the device under test that must remain within a maximum variation of $\pm 5\%$.

- **Post-processing**

The procedure for spatial peak SAR evaluation has been implemented according to the IEEE1528 and IEC 62209-1/2 standards. It can be conducted for 1g and 10g.

The software allows evaluations that combine measured data and robot positions, such as:

- ✓ Maximum search
- ✓ Extrapolation
- ✓ Boundary correction
- ✓ Peak search for averaged SAR

Interpolation between the measured points is performed when the resolution of the grid is not fine enough to compute the average SAR over a given mass.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation is determined by the surface detection distance and the probe sensor offset. Several measurements at different distances are necessary for the extrapolation.

A.4 System and Liquid Check

A.4.1 System Check

The system performance check verifies that the system operates within its specifications. System and operator errors can be detected and corrected. It is recommended that the system performance check be performed prior to any usage of the system in order to guarantee reproducible results.

The system performance check uses normal SAR measurements in a simplified setup with a well characterized source. This setup was selected to give a high sensitivity to all parameters that might fail or vary over time. The system check does not intend to replace the calibration of the components, but indicates situations where the system uncertainty is exceeded due to drift or failure.

In the simplified setup for system check, the EUT is replaced by a calibrated dipole and the power source is replaced by a controlled continuous wave generated by a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the phantom at the correct distance.

The equipment setup is shown below:

- ✓ Signal Generator
- ✓ Amplifier
- ✓ Directional coupler
- ✓ Power meter
- ✓ Calibrated dipole

The output power on dipole port must be set to 20dBm (100mW) and SAR results are normalized to a forward power of 1W to compare the values with the calibration reports results as described at IEEE 1528 and IEC 62209 standards.

A.4.2 Liquid Check

The dielectric parameters check is done prior to the use of the tissue simulating liquid. The verification is made by comparing the relative permittivity and conductivity to the values recommended by the applicable standards.

The liquid verification was performed using the following test setup:

- ✓ VNA (Vector Network Analyzer)
- ✓ Open-Short-Load calibration kit
- ✓ RF Cable
- ✓ Open-Ended Coaxial probe
- ✓ DAK software tool
- ✓ SAR Liquid
- ✓ De-ionized water
- ✓ Thermometer

These are the target dielectric properties of the tissue-equivalent liquid material as defined in FCC OET KDB 865664 D01.

Frequency (MHz)	Body SAR	
	ϵ_r	σ (S/m)
150	61.9	0.80
300	58.2	0.92
450	56.7	0.94
835	55.2	0.97
900	55.0	1.05
1450	54.0	1.30
1800-2000	53.3	1.52
2450	52.7	1.95
3000	52.0	2.73
5800	48.2	6.00

(ϵ_r = relative permittivity, σ = conductivity and ρ = 1000 kg/m³)

The measurement system implement a SAR error compensation algorithm as documented in IEEE Std 1528-2013 (equivalent to draft standard IEEE P1528-2011) to automatically compensate the measured SAR results for deviations between the measured and required tissue dielectric parameters (applied to only scale up the measured SAR, and not downward) so, according to FCC OET KDB 865664 D01, the tolerance for ϵ_r and σ may be relaxed to $\pm 10\%$.

SPEAG System Uncertainty budget (IEC 62209-2:2010)

A.7 RF Exposure Limits

SAR assessments have been made in line with the requirements of FCC 47 CFR Part §2.1093 and RSS 102, Issue 5 on the limitation of exposure of the general population / uncontrolled exposure for portable devices.

Exposure Type	General Population / Uncontrolled Environment
Peak spatial-average SAR (averaged over any 1 gram of tissue)	1.6 W/kg
Whole body average SAR	0.08 W/kg
Peak spatial-average SAR (extremities) (averaged over any 10 grams of tissue)	4.0 W/kg

Annex B. Test Results

B.1 Test Conditions

B.1.1 SAR Test positions relative to the phantom

The device under test was the Intel® Dual Band Wireless-AC 3168 card using a SkyCross Electronics antenna as reference antenna. The transmitter was placed more than 10cm away from the phantom to avoid interferences, and using a host laptop to control it.

The card was operated utilizing proprietary software (DRTU version 1.8.4-02304) and each channel was measured using a broadband power meter to determine the maximum average power.

All six sides of the antenna were tested for SAR compliance with the antenna placed at 8mm beneath the phantom. The adjacent edges of the antenna were positioned perpendicular to the phantom.

Considering the antenna sides in *Annex F*, the surfaces/edges to be measured for each antenna are:

Position	Distance	Antenna	
		Main	Aux
	8mm	<ul style="list-style-type: none"> • Back surface • Front surface • Top edge • Bottom edge • Right edge • Left edge 	<ul style="list-style-type: none"> • Back surface • Front surface • Top edge • Bottom edge • Right edge • Left edge

B.1.2 Test signal, Output power and Test Frequencies

The device was put into operation by using an own control software (DRTU version 1.8.4-02304) to program the test mode required for select the continuous transmission with 100% duty cycle.

The output power of the device was set to transmit at maximum power for all tests.

B.1.3 Evaluation Exclusion and Test Reductions

SAR test reduction

General SAR test reduction

According to FCC OET KDB 447498 D01, testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR for the mid-band or highest output power channel is:

- ≤ 0.8 W/kg or 2.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≤ 100 MHz
- ≤ 0.6 W/kg or 1.5 W/kg, for 1-g or 10-g respectively, when the transmission band is between 100 MHz and 200 MHz
- ≤ 0.4 W/kg or 1.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≥ 200 MHz

WLAN SAR Test reduction

Transmission Mode	SAR test exclusion/reduction
DSSS	<p>According to FCC OET KDB 248227 D01 v02r02, SAR is measured for 2.4 GHz 802.11b, SAR test reduction is determined according to the following:</p> <ul style="list-style-type: none"> ▪ When the reported SAR of the highest measured maximum output power channel for the exposure configuration is ≤ 0.8 W/kg, no further SAR testing is required for 802.11b DSSS in that exposure configuration. ▪ When the reported SAR is > 0.8 W/kg, SAR is required for that exposure configuration using the next highest measured output power channel. When any reported SAR is > 1.2 W/kg, SAR is required for the third channel. <p>According to FCC OET KDB 248227 D01 v02r02, SAR is not required for 2.4 GHz OFDM conditions when the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg.</p>
OFDM	<p>According to FCC OET KDB 248227 D01 v02r02, 802.11a/g/n/ac modes have the same specified maximum output power, largest channel bandwidth, lowest order modulation and lowest data rate, the lowest order 802.11 mode is selected; i.e., 802.11a is chosen over 802.11n then 802.11ac or 802.11g is chosen over 802.11n.</p> <p>According to FCC OET KDB 248227 D01 v02r02, an <i>initial test configuration</i> is determined for OFDM and DSSS transmission modes according to the channel bandwidth, modulation and data rate combination(s) with the highest maximum output power specified for production units in each standalone and aggregated frequency band. SAR is measured using the highest measured maximum output power channel. SAR test reduction for subsequent highest output test channels is determined according to reported SAR of the initial test configuration.</p> <p>The <i>initial test configuration</i> for 5 GHz OFDM transmission modes is determined by the 802.11 configuration with the highest maximum output power specified for production units, including tune-up tolerance, in each standalone and aggregated frequency band. SAR for the initial test configuration is measured using the highest maximum output power channel determined by the default power measurement procedures.</p> <p>According to FCC OET KDB 248227 D01 v02r02, when the reported SAR of the initial test configuration is > 0.8 W/kg, SAR measurement is required for subsequent next highest measured output power channel(s) in the initial test configuration until reported SAR is ≤ 1.2 W/kg or all required channels are tested.</p>

B.2 Conducted Power Measurements

B.2.1 WLAN 2.4GHz (DTS)

Band	Mode	Data Rate	Ch #	Freq [MHz]	Main		SAR Test?
					Avg Pwr [dBm]	Tune-up Pwr [dBm]	
2.4GHz (DTS)	802.11b	1Mbps	1	2412	17.34	17.50	Yes
			6	2437	17.41	17.50	
			11	2462	17.28	17.50	
	802.11g	6Mbps	1	2412	NR ¹	17.50	No ²
			6	2437		17.50	
			11	2462		17.50	
	802.11n20	HT0	1	2412		17.50	No ²
			6	2437		17.50	
			11	2462		17.50	
	802.11n40	HT0	3	2422		17.50	No ²
			6	2437		17.50	
			9	2452		17.50	

Initial test configuration

1. NR: Not Required
2. As per FCC OET KDB 248227 D01, conducted output power and SAR testing are not required for 802.11g/n20/n40 channels when the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is $\leq 1.2W/kg$.

B.2.2 WLAN 5GHz (UNII)

5.2GHz and 5.3GHz (UNII-1 and UNII-2A)

Band	Mode Data Rate	Ch #	Freq [MHz]	Main		SAR Test?
				Avg Pwr [dBm]	Tune-up Pwr [dBm]	
5.2GHz (UNII-1)	802.11a 6Mbps	36	5180	NR ¹	17.00	No ²
		40	5200		17.00	
		44	5220		17.00

					Bottom Edge	0.20	0.038	0.04	
					Right Edge	0.20	0.017	0.02	
					Top Edge	0.20	0.409	0.43	

B.5.4 802.11a/n/ac – 5.8 GHz – UNII-3

Ant	Mode Data rate	BW (MHz)	Ch #	Freq (MHz)	Position	Correct. Factor (dB)	SAR 1g (W/kg)	Reported SAR 1g (W/kg)	Plot #
Main	802.11ac80 VHT0	80	155	5775	Left Edge	0.10	0.393	0.40	4
					Back Face	0.10	0.190	0.19	
					Front Face	0.10	0.341	0.35	
					Bottom Edge	0.10	0.018	0.02	
					Right Edge	0.10	0.019	0.02	
					Top Edge	0.10	0.275	0.28	

B.5.5 Bluetooth – 2.4GHz – DSSS

Ant	Mode Data rate	BW (MHz)	Ch #	Freq (MHz)	Position	Correct. Factor (dB)	SAR 1g (W/kg)	Reported SAR 1g (W/kg)	Plot #
Aux	802.15 DH5	20	0	2402	Left Edge	0.11	0.055	0.06	
					Back Face	0.11	0.083	0.08	5
					Front Face	0.11	0.051	0.05	
					Bottom Edge	0.11	0.014	0.01	
					Right Edge	0.11	0.017	0.02	
					Top Edge	0.11	0.027	0.03	

B.6 SAR Measurement Variability

According to FCC OET KDB 865664, SAR Measurement variability is assessed when the maximum initial measured SAR is >0.8 W/kg for a certain band/mode.

As all measured SAR results are below 0.8W/Kg, SAR variability is not required.

B.7 Simultaneous Transmission SAR Evaluation

According to FCC OET KDB 447498 D01, when the sum of 1g SAR for all simultaneously transmitting antennas in an operating mode and exposure condition combination is within the SAR limit, SAR test exclusion applies to that simultaneous transmission configuration.

Chain	Position	Highest Reported SAR (1g)		
		WLAN 2.4GHz	WLAN 5GHz	Bluetooth
Main	Left Edge	0.71	0.60	
	Back Face	0.50	0.28	
	Front Face	0.50	0.50	
	Bottom Edge	0.09	0.04	
	Right Edge	0.15	0.02	
	Top Edge	0.14	0.77	
Aux	Left Edge			0.06
	Back Face			0.08
	Front Face			0.05
	Bottom Edge			0.01
	Right Edge			0.02
	Top Edge			0.03

Position	Simultaneous Tx Antenna Combination		Σ SAR 1g (W/Kg)	Limit (W/kg)
	Main Antenna	Aux Antenna		
Left Edge	WLAN 2.4GHz	BT	0.77	1.6
	WLAN 5GHz	BT	0.66	
Back Face	WLAN 2.4GHz	BT	0.58	
	WLAN 5GHz	BT	0.36	
Front Face	WLAN 2.4GHz	BT	0.55	
	WLAN 5GHz	BT	0.55	
Bottom Edge	WLAN 2.4GHz	BT	0.10	
	WLAN 5GHz	BT	0.05	
Right Edge	WLAN 2.4GHz	BT	0.17	
	WLAN 5GHz	BT	0.04	
Top Edge	WLAN 2.4GHz	BT	0.17	
	WLAN 5GHz	BT	0.80	

Considering the results described above and according to the simultaneous transmission evaluation exclusions described in FCC OET KDB 447498 D01, no SAR to peak location measurements are required.

Annex C. Test System Plots

1.	2.4GHz - 802.11b, CH6, Main Antenna – Left Edge	33
2.	5.3GHz - 802.11n40, CH54, Main Antenna – Top Edge	34
3.	5.6GHz - 802.11n40, CH110, Main Antenna – Left Edge	35
4.	5.8GHz - 802.11n40, CH118, Main Antenna – Left Edge	36

1. 2.4GHz - 802.11b, CH6, Main Antenna – Left Edge

Test Laboratory: Intel WRF Lab; Date/Time: 1/13/2016 6:27:54 PM

DUT: 3168NGW; Type: Wireless Module; Serial: 3413E84F11FE

Communication System: UID 0, 802.11 (0); Communication System Band: 2.4GHz; Frequency: 2437 MHz; Communication System PAR: 0 dB

Medium parameters used (interpolated): $f = 2437$ MHz; $\sigma = 1.994$ S/m; $\epsilon_r = 48.3$; $\rho = 1000$ kg/m³

Phantom section: Flat Section

Measurement Standard: DASYS (IEEE/IEC/ANSI C63.19-2011)

DASY Configuration:

- Probe: EX3DV4 - SN3978; ConvF(7.22, 7.22, 7.22); Calibrated: 6/15/2015;
 - Modulation Compensation:
- Sensor-Surface: 4mm (Mechanical Surface Detection), $z = -9.0, 31.0$
- Electronics: DAE4 Sn1429; Calibrated: 6/11/2015
- Phantom: ELI v5.0 (30deg probe tilt); Type: QDOVA002BA;
- DASYS2 52.8.8(1222);

DTS - 802.11b - Ch6 - 2437MHz - Left Edge/Area Scan (31x61x1):

Interpolated grid: $dx=1.200$ mm, $dy=1.200$ mm

[Info: Interpolated medium parameters used for SAR evaluation.](#)

Maximum value of SAR (interpolated) = 0.865 W/kg

DTS - 802.11b - Ch6 - 2437MHz - Left Edge/Zoom Scan (7x7x7)/Cube 0:

Measurement grid: $dx=5$ mm, $dy=5$ mm, $dz=5$ mm

Reference Value = 16.24 V/m; Power Drift = -0.05 dB

Peak SAR (extrapolated) = 1.63 W/kg

SAR(1 g) = 0.693 W/kg; SAR(10 g) = 0.298 W/kg

[Info: Interpolated medium parameters used for SAR evaluation.](#)

Maximum value of SAR (measured) = 0.810 W/kg

0 dB = 0.810 W/kg = -0.92 dBW/kg

2. 5.3GHz - 802.11n40, CH54, Main Antenna – Top Edge

Test Laboratory: Intel WRF Lab; Date/Time: 1/21/2016 4:16:07 PM

DUT: 3168NGW; Type: Wireless Module; Serial: 3413E84F11FE

Communication System: UID 0, 802.11 (0); Communication System Band: 5GHz; Frequency: 5270 MHz; Communication System PAR: 0 dB
 Medium parameters used (interpolated): $f = 5270$ MHz; $\sigma = 5.261$ S/m; $\epsilon_r = 45.33$; $\rho = 1000$ kg/m³
 Phantom section: Flat Section
 Measurement Standard: DASYS5 (IEEE/IEC/ANSI C63.19-2011)

DASY Configuration:

- Probe: EX3DV4 - SN3978; ConvF(4.21, 4.21, 4.21); Calibrated: 6/15/2015;
 - Modulation Compensation:
- Sensor-Surface: 2mm (Mechanical Surface Detection (Locations From Previous Scan Used)), Sensor-Surface: 2mm (Mechanical Surface Detection), $z = -9.0, 27.0$
- Electronics: DAE4 Sn1429; Calibrated: 6/11/2015

DUT: Dipole D5GHzV2; Type: D5GHzV2; Serial: D5GHzV2 - SN:1164

Communication System: UID 0, CW (0); Communication System Band: D5GHz (5000.0 - 6000.0 MHz); Frequency: 5600 MHz; Communication System PAR: 0 dB
 Medium parameters used: $f = 5600$ MHz; $\sigma = 5.746$ S/m; $\epsilon_r = 44.647$; $\rho = 1000$ kg/m³
 Phantom section: Flat Section
 Measurement Standard: DASy5 (IEEE/IEC/ANSI C63.19-2011)

DASy Configuration:

- Probe: EX3DV4 - SN3978; ConvF(3.67, 3.67, 3.67); Calibrated: 6/15/2015;
 - Modulation Compensation:
- Sensor-Surface: 2mm (Mechanical Surface Detection), $z = -9.0, 25.0$
- Electronics: DAE4 Sn1429; Calibrated: 6/11/2015
- Phantom: ELI v5.0 (30deg probe tilt); Type: QDOVA002BA;
- DASy52 52.8.8(1222);

System-Check-5GHz-01-21-2016/System check 5600MHz 2/Area Scan

(61x81x1): Interpolated grid: $dx=1.000$ mm, $dy=1.000$ mm
 Maximum value of SAR (interpolated) = 19.1 W/kg

System-Check-5GHz-01-21-2016/System check 5600MHz 2/Zoom Scan

(7x7x12)/Cube 0: Measurement grid: $dx=4$ mm, $dy=4$ mm, $dz=2$ mm
 Reference Value = 61.32 V/m; Power Drift = -0.03 dB
 Peak SAR (extrapolated) = 36.5 W/kg
SAR(1 g) = 8.42 W/kg; SAR(10 g) = 2.41 W/kg
 Maximum value of SAR (measured) = 17.8 W/kg

0 dB = 17.8 W/kg = 12.50 dBW/kg

10. System Check Body Liquid 5800MHz

Test Laboratory: Intel WRF Lab; Date/Time: 1/20/2016 6:52:42 PM

DUT: Dipole D5GHzV2; Type: D5GHzV2; Serial: D5GHzV2 - SN:1164

Communication System: UID 0, CW (0); Communication System Band: D5GHz (5000.0 - 6000.0 MHz); Frequency: 5800 MHz; Communication System PAR: 0 dB
 Medium parameters used: $f = 5800$ MHz; $\sigma = 6.037$ S/m; $\epsilon_r = 44.239$; $\rho = 1000$ kg/m³
 Phantom section: Flat Section
 Measurement Standard: DASy5 (IEEE/IEC/ANSI C63.19-2011)

DASY Configuration:

- Probe: EX3DV4 - SN3978; ConvF(4.01, 4.01, 4.01); Calibrated: 6/15/2015;
 - Modulation Compensation:
- Sensor-Surface: 2mm (Mechanical Surface Detection), $z = -9.0, 25.0$
- Electronics: DAE4 Sn1429; Calibrated: 6/11/2015
- Phantom: ELI v5.0 (30deg probe tilt); Type: QDOVA002BA;
- DASy52 52.8.8(1222);

System-Check-5GHz-01-18-2016/System check 5800MHz 2/Area Scan

(61x81x1): Interpolated grid: $dx=1.000$ mm, $dy=1.000$ mm
 Maximum value of SAR (interpolated) = 14.9 W/kg

System-Check-5GHz-01-18-2016/System check 5800MHz 2/Zoom Scan

(10x10x12)/Cube 0: Measurement grid: $dx=4$ mm, $dy=4$ mm, $dz=2$ mm
 Reference Value = 53.36 V/m; Power Drift = 0.09 dB
 Peak SAR (extrapolated) = 32.3 W/kg
SAR(1 g) = 7.01 W/kg; SAR(10 g) = 1.97 W/kg
 Maximum value of SAR (measured) = 15.2 W/kg

0 dB = 15.2 W/kg = 11.82 dBW/kg

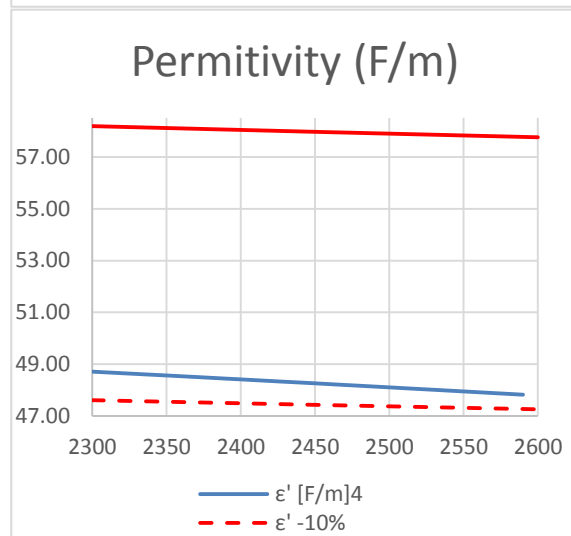

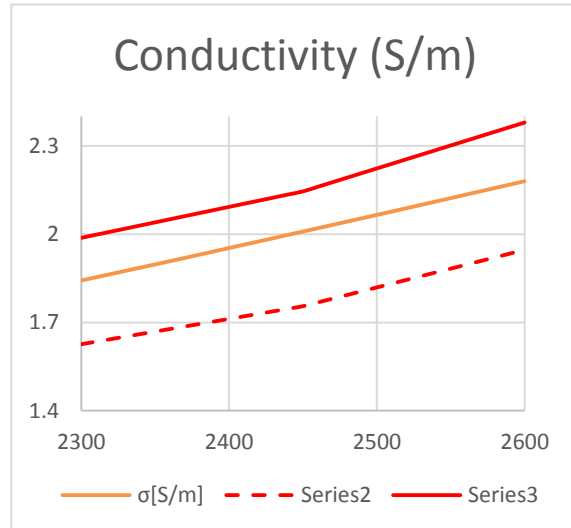

Annex D. Calibration Certificates

Device	Type/Model	Serial Number	Manufacturer	Calibration Certificate
Dosimetric E-field Probe	EX3DV4	3978	SPEAG	
2450MHz System Validation Dipole	D2450V2	937	SPEAG	
5GHz System Validation Dipole	D5GHzv2	1164	SPEAG	

Annex E. TSL Dielectric Parameters

Body 2450MHz-
