

26. June 2006

1.

The difference between the two tested device types is that RM-170 has a camera and RM-171 does not. Both devices have similar RF characteristics and SAR testing of one was minimized based on the measured performance of the other. To give the full picture of the logic of the chosen test cases, it is necessary to retain data of both products in a single report. We intend to use the same report for filing of RM-170 and RM-171.

2.

Manual is revised, (E50_User_Guide_en-US_FCC.pdf).
