Subject: Letter of Diane Poole from 29/03/01

Please find the answers to your two questions.

1. The requirement of sec.15.231 (a)(1) is provided as described below:
All the transmissions are controlled by a micro controller MC68HC705KJ1. The micro on the modem job ensures that the transmissions are less then 100 msec each time. The mico supplies 0V to disable or 5V to enable to the base of a transistor which controls the transmitter operation.
2. The transmission content is a short data string (16 to 48 bit) according to the button the user pressed on the PC.

Sincerely

Galit Grodetsky
