

The test equipment configuration of Figure 1 was used with the video generator supplying the video input waveform. For this test, the aural carrier was left energized. A variable frequency sine wave input video waveform was used. The RF sideband output level was measured for the sidebands below and above the visual carrier. The frequency response was plotted. A spectrum plot is provided for the transmitter running at 2000 Watts to confirm that the radiated envelope meets the requirements as outline in Part 74 Rule 750.

POWER OUTPUT = 2000 WATTS
