

BTM511 Approvals Test Sample Description

The BTM511 Bluetooth Module is a surface mount module. To facilitate the testing of this module it was soldered onto a development kit PCB. This PCB provides a power supply connection (via an on-board regulator – allowing the connection of a wide variety of external power supplies) and the data interface to the controlling PC. In addition the dev kit provides access to all of the I/O pins on the module and an example antenna configuration. This development kit is an open PCB construction and should not provide any additional shielding to the module.

A photograph of the development kit is shown below:
