

Environmental evaluation and exposure limit according to
FCC CFR 47 part 15, §15.247(b)(5) and §1.1307

MPE limit for power density for general population/uncontrolled exposure according to FCC §1.1310 is 1 mW/cm².

$$\text{A power density } P \text{ (mW/cm}^2\text{)} = \frac{P_T}{4\pi r^2}, \text{ where}$$

P_T - transmitted power.

For BSR-2.4:

P_T is equal to transmitter output power 23.33 dBm plus maximum antenna gain 11 dBi, the maximum equivalent isotropically radiated power (e.i.r.p.) is 34.33 dBm = 2710 mW.

$$1(\text{mW/cm}^2) = 2710 \text{ mW} / 4\pi r^2$$

The power density at 20 cm (minimum safe distance, required for mobile devices),
calculated as follows:

$$2710 \text{ mW} / 4\pi (20 \text{ cm})^2 = 0.54 \text{ mW/cm}^2 < 1 \text{ mW/cm}^2$$

For SPR-2.4:

P_T is equal to transmitter output power 18.67 dBm plus maximum antenna gain 15 dBi, the maximum equivalent isotropically radiated power (e.i.r.p.) is 34 dBm = 2512 mW.

$$1(\text{mW/cm}^2) = 2512 \text{ mW} / 4\pi r^2$$

The power density at 20 cm (minimum safe distance, required for mobile devices),
calculated as follows:

$$2512 \text{ mW} / 4\pi (20 \text{ cm})^2 = 0.5 \text{ mW/cm}^2 < 1 \text{ mW/cm}^2$$

Public cannot be exposed to dangerous RF level.
