TEST REPORT

ACCORDING TO: FCC part 15 subpart C, §15.247

FOR:

Airspan Networks (Israel) Ltd. Subscriber premises hybrid transceiver

Model: SPR-2.4

This report is in conformity with ISO/ IEC 17025. The A2LA logo endorsement applies only to the test methods and the standards that are listed in the scope of Hermon Laboratories accreditation. The test results relate only to the items tested. This test report shall not be reproduced in any form except in full with the written approval of Hermon Laboratories Ltd.

5 Tests summary

| Test | Status |
|---|---|
| Transmitter characteristics | |
| Section 15.247(a)2, 6 dB bandwidth | Provided in MARRAD_FCC. 14534 |
| Section 15.247(b)3, Peak output power | Provided in MARRAD_FCC. 14534 |
| Section 15.247(b)5, RF exposure | Provided in MARRAD_FCC. 14534 |
| Section 15.247(c), Conducted spurious emissions | Provided in MARRAD_FCC. 14534 |
| Section 15.247(c), Radiated spurious emissions | Provided in MARRAD_FCC. 14534 |
| Section 15.247(d), Peak power density | Pass |
| Section 15.207(a), Conducted emission | Pass |
| Section 15.203, Antenna requirement | Not required (permanently attached antenna) |
| Unintentional emissions | |
| Section 15.107, Conducted emission at AC power port | Pass |
| Section 15.109, Radiated emission | Provided in MARRAD_FCC. 14534 |
| Section 15.111, Conducted emission at receiver antenna port | Not required |

Testing was completed against all relevant requirements of the test standard. The results obtained indicate that the product under test complies in full with the requirements tested.

The test results relate only to the items tested. Pass/ fail decision was based on nominal values.

6 EUT description

6.1 General information

A subscriber premises radio, SPR-2.4, is a part of a broadband fixed cellular wireless access system WipLL. The system provides a radio link between an end-user of the telecom network (a subscriber) and a network itself to give high-speed data access. The EUT is an outdoor unit comprising a hybrid system transceiver (8FSK digital modulation with frequency hopping, data rate 1, 2, 3 Mbps and 1.33, 4 Mbps) that transmits and receives data to and from the base station. The transceiver operates in 2402 MHz to 2480 MHz frequency range and is equipped with a 15 dBi gain directional internal antenna.

At the network layer, the SPR performs routing functions between a subscriber's Ethernet network and wireless network, and contains a routing table that can support up to 16 entries.

The SPR is connected to a subscriber data adapter (SDA), which provides 48 V DC power.

6.2 Test configuration

7 Measurements

7.1 Peak spectral power density

7.1.1 General

This test was performed to measure the peak spectral power density at the transmitter RF antenna connector. Specification test limits are given in Table 7.1.1.

Table 7.1.1 Peak spectral power density limits

| Assigned frequency range, | Measurement bandwidth, | Peak spectral power density, |
|---------------------------|------------------------|------------------------------|
| MHz | kHz | dBm |
| 2400.0 - 2483.5 | 3.0 | 8.0 |

7.1.2 Test procedure

- 7.1.2.1 The EUT was set up as shown in Figure 7.1.1, energized and its proper operation was checked.
- 7.1.2.2 The EUT was adjusted to produce maximum available to end user RF output power.
- **7.1.2.3** The frequency span of spectrum analyzer was set to capture the entire 6 dB band of the transmitter, in peak hold mode with resolution bandwidth set to 3.0 kHz, video bandwidth wider than resolution bandwidth, auto sweep time and sufficient number of sweeps was allowed for trace stabilization. The spectrum lines spacing was verified to be wider than 3 kHz. Otherwise the resolution bandwidth was reduced until individual spectrum lines were resolved and the power of individual spectrum lines was integrated over 3 kHz band.
- **7.1.2.4** The peak of emission was zoomed with span set just wide enough to capture the emission peak area and sweep time was set equal to span width divided by resolution bandwidth. Spectrum analyzer was set in peak hold mode, sufficient number of sweeps was allowed for trace stabilization and peak spectral power density was measured as provided in Table 7.1.2 and associated plots.

7.2 Conducted emissions

7.2.1 General

This test was performed to measure common mode conducted emissions at the power ports. The EUT antenna connector was terminated with 50 Ohm dummy load. Specification test limits are given in Table 7.2.1. The worst test results (the lowest margins) were recorded in Tables 7.2.1, 7.2.2 and shown in the associated plots.

Table 7.2.1

Limits for conducted emissions

| Frequency, | Class B lir | nit, dB(μV) |
|------------|-------------|-------------|
| MHz | QP | AVRG |
| 0.15 - 0.5 | 66 - 56* | 56 - 46* |
| 0.5 - 5.0 | 56 | 46 |
| 5.0 - 30 | 60 | 50 |

The limit decreases linearly with the logarithm of frequency.

7.2.2 Test procedure

- **7.2.2.1** The EUT was set up as shown in Figure 7.2.1, energized and the performance check was conducted.
- **7.2.2.2** The measurements were performed at SDA power terminals and PC power terminals of SPR unit with the LISN, connected to a spectrum analyzer in the frequency range referred to in Tables 7.2.2, 7.2.3. Unused coaxial connector of the LISN was terminated with 50 Ohm. Quasi-peak and average detectors were used throughout the testing.
- 7.2.2.3 The position of the device cables was varied to determine maximum emission level.

9 APPENDIX B Measurement uncertainties

| Expanded uncertainty at 95% confidence in Hermon | Labs EMC measurements |
|--|-----------------------|
|--|-----------------------|

| Test description | Expanded uncertainty |
|---|--------------------------------|
| Conducted carrier power at RF antenna connector | Below 12.4 GHz: ± 1.7 dB |
| | 12.4 GHz to 40 GHz: ± 2.3 dB |
| Conducted emissions at RF antenna connector | 9 kHz to 2.9 GHz: ± 2.6 dB |
| | 2.9 GHz to 6.46 GHz: ± 3.5 dB |
| | 6.46 GHz to 13.2 GHz: ± 4.3 dB |
| | 13.2 GHz to 22.0 GHz: ± 5.0 dB |
| | 22.0 GHz to 26.8 GHz: ± 5.5 dB |
| | 26.8 GHz to 40.0 GHz: ± 4.8 dB |

The test equipment has been calibrated according to its recommended procedures and is within the manufacturer's published limit of error. The standards and instruments used in the calibration system conform to the present requirements of ISO/IEC 17025 (or alternately ANSI/NCSL Z540-1).

The laboratory calibrates its measurement standards by a third party (traceable to NIST, USA) on a regular basis according to equipment manufacturer requirements. The Hermon Labs EMC measurements uncertainty is given in the table above.

10 APPENDIX C Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private, EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01).
