3 EUT description

3.1 General description

The EUTs, outdoor units (ODU), model names "BSR 900MHz TDD Ext A", "BSR 900MHz TDD V-pol A", "SPRL 900MHz TDD Ext A" and "SPRL 900MHz TDD V-pol A", are part of a WipLL broadband fixed cellular wireless access system. The system provides a radio link between an end-user (a subscriber) and a network itself to give high-speed data access. The EUT is a hybrid system transceiver operating in 903 MHz to 927 MHz range.

The "BSR/SPRL 900MHz TDD Ext A" models are equipped with an 11 dBi gain omnidirectional or 15.5 dBi gain (dual polarization or vertical polarization) external antenna, the "BSR/SPRL 900MHz TDD V-pol A" models - with a 8 dBi gain internal antenna. The BSR is installed outside the base station site and typically is mounted on a pole, the SPRL is installed at the subscriber's premises. The SPRL is a radio transceiver that transmits and receives traffic to and from the base station (i.e., BSR), respectively. The SPRL provides subscribers with "always-on" Internet, high-speed data-only, or data and voice (VoIP) services and is configured with a unique BSR reference number, preventing the SPRL from relocating to another subscriber premises without authorization.

The SPRL has identical to the BSR chassis, the same dimensions, contains the same PCB components and differs only in the software.

The EUT is powered via a subscriber data adapter (SDA), which provides 48 V DC power.

3.2 EUT test configuration

Throughout testing the radio communication was established. The EUT operating frequencies generated by clocks and oscillators: 350 MHz - first IF, 6 MHz – second IF, $[F_{\text{operating}} + 350 \text{ MHz}]$ – first LO, 356 MHz – second LO.

4.6 Radiated emissions which fall in restricted bands test according to §15.247(c) and § 15.205, §15.209(a)

| | |
|----------------------------|----------------------------|
| METHOD OF MEASUREMENTS: | ANSI 63.4 §13.1.4/ §13.1.5 |
| TEST PERFROMED IN: | Anechoic chamber, OATS |
| OPERATING FREQUENCY RANGE: | 903 -927 MHz |
| RATED RF OUTPUT POWER: | 23 dBm |
| TEST DISTANCE | 3 m |
| MEASUREMENT UNCERTAINTY: | ± 4.3 dB |

LIMIT

Radiated emissions, which fall in the restricted bands, must comply with §15.209(a) limits.

TEST PROCEDURE

The measurements were performed at maximum output power settings and 3 Mbit/s modulation rate that yield maximum power density.

The test was performed with transmitter operating at 3 carrier frequencies $F_{\min} = 903$ MHz, $F_{\text{middle}} = 915$ MHz, $F_{\max} = 927$ MHz. The measurements were performed at 3 m test distance from 150 kHz to 2.9 GHz in the anechoic chamber, up to the tenth harmonic of the highest fundamental frequency – at the OATS. The EUT was placed on a wooden 80 cm height turntable.

150 kHz – 30 MHz frequency range. The loop antenna was positioned with its plane vertical. The loop center was 1 meter above the ground plane. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated about its vertical axis.

30 MHz – 9.2 GHz frequency range. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

All emissions were found below the specified limit. For test results refer to Plots A47 – A94 for EUT with internal antenna and to Plots A95 – A139 – for EUT with external antenna.

TEST PROCEDURE

The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The unused coaxial connector of the LISN was terminated with 50 Ω. The measurements were made with quasi-peak and average detectors as referred to in the tables. The position of the EUT cables was varied to determine maximum emission level.
