Environmental evaluation and exposure limit according to FCC CFR 47part 1, §1.1307, §1.1310

The transceiver is classified as fixed, the calculation was done to check a safe distance.

Limit for power density for general population/uncontrolled exposure is 1 mW/cm² for 1500 -100000 MHz frequency range.

The power density P (mW/cm²) = P_T / 4π r², where

 P_{T} is the transmitted power, which is equal to the peak transmitter output power plus maximum antenna gain. The maximum equivalent isotropically radiated power EIRP is

$$P_T = 28.33 \text{ dBm} + 10.5 \text{ dBi} = 38.83 \text{ dBm} = 7638 \text{ mW}, \text{ where}$$

28.33 dBm is the EUT maximum output power, 10.5 dBi – antenna gain.

The minimum safe distance "r", where RF exposure does not exceed FCC permissible limit, is

$$r = sqrt \{ PT / (Px4\pi) \} = sqrt \{ 7638 / 12.56 \} = 24.66 cm.$$

A warning about a safe distance is contained in the user manual.
