

**Environmental evaluation and exposure limit according to FCC CFR 47part 1,
§1.1307, §1.1310**

The transceiver is classified as fixed, the calculation was done to confirm a safe distance.

Limit for power density for general population/uncontrolled exposure is 1 mW/cm^2 for 1500 -100000 MHz frequency range.

The power density $P \text{ (mW/cm}^2\text{)} = P_T / 4\pi r^2$, where

P_T is the transmitted power, which is equal to the peak transmitter output power plus maximum antenna gain. The maximum equivalent isotropically radiated power EIRP is

$$P_T = 35.53 \text{ dBm} + 17 \text{ dBi} = 52.53 \text{ dBm} = 179060 \text{ mW, where}$$

35.53 dBm is the EUT maximum output power,
17 dBi – antenna gain.

The minimum safe distance “r”, where RF exposure does not exceed FCC permissible limit, is

$$r = \text{sqrt} \{ P_T / (P \times 4\pi) \} = \text{sqrt} \{ 179060 / 12.56 \} \approx 119.4 \text{ cm.}$$

General public cannot be exposed to dangerous RF level.
