

Please forward this to Mr. Joe Dichoso

Mr. DiChoso,

Attached is a report (in .xls format) and data photographs for our TV transmitter, PIV-TV1, per your request of two weeks ago.

During the data gathering Global Eng decided that the power output needed to be reduced by one or two dB to comply with your spec. This was accomplished by changing one of the capacitors, located in the output filter network, from 5.0 pF to 5.6 pF. This also further reduced the harmonic output level.

A revised schematic diagram is included with this data set showing this change to C10.
