TEST REPORT

Report No. : AJ005023-001

Date : 2007 June 11

1 General Information

1.1 General Description

The equipment under test (EUT) is a superregenerative receiver for RC Monster Jam Stunt. It operates at 49.860MHz and the oscillation of radio control an LRC circuit. The EUT is powered by 6 x 1.5V AA size batteries. When received a forward, backward, turn right, turn left or self-turning signal, it will go to the corresponding direction or will turn around itself.

The brief circuit description is listed as follows:

- Q2 and associated circuit act as receiver.
- U1, U3 and associated circuit act as decoder.
- Q15, Q27, Q1 and associated circuit act as voltage controller.
- $Q4 \sim Q9$ and associated circuit act as M1 motor controller.
- $Q10 \sim Q14$, Q3 and associated circuit act as M2 motor controller.
- $Q17 \sim Q22$ and associated circuit act as M3 motor controller.

Date : 2007 June 11

1.2 Location of the test site

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.4 – 2003. A Semi-Anechoic Chamber Testing Site is set up for investigation and located at:

Ground Floor, Yan Hing Centre, 9 – 13 Wong Chuk Yeung Street, Fo Tan, Shatin, New Territories, Hong Kong.

Conducted emissions measurements are investigated and also taken pursuant to the procedures of ANSI C63.4 - 2003. A shielded room is located at :

Ground Floor, Yan Hing Centre, 9 – 13 Wong Chuk Yeung Street, Fo Tan, Shatin, New Territories, Hong Kong.

TEST REPORT

Report No. : AJ005023-001

Date : 2007 June 11

2 Description of the radiated emission test

2.1 Test Procedure

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.4 - 2003.

The equipment under test (EUT) was placed on a non-conductive turntable with dimensions of 1.5m x 1m and 0.8m high above the ground. 3m from the EUT, a broadband antenna mounting on the mast received the signal strength. The turntable was rotated to maximize the emission level. The antenna was then moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated.

For below 30MHz, a loop antenna with its vertical plane is placed 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1 m above the ground.

A signal generator was used to radiate an unmodulated continuous wave (CW) signal to the EUT (superregenerative receiver) at its operating frequency in order to "cohere" the characteristic broadband emissions from the receiver.

2.2 Test Result

The highest emissions meeting the requirement of section 15.109 are based on measurements employing the CISPR quasi-peak detector below 1000MHz and average detector for frequencies above 1000MHz.

It was found that the EUT meet the FCC requirement.

Date : 2007 June 11

3 Description of the Line-conducted Test

3.1 Test Procedure

Conducted emissions measurements are investigated and also taken pursuant to the procedures of ANSI C63.4 - 2003. The EUT was setup as described in the procedures, and both lines were measured.

3.2 Test Result

No measurement is required as the EUT is a battery-operated product.
