Issue Date: 13th February, 2006

Test of: Raymarine Ltd.
RD218 Analog 2kW Radome Scanner
FCC Part 80: 1998 and

FCC Part 2: 1998

#### **Client Information** 1

Company Name	Raymarine Ltd.
Address:	Robinson Way Anchorage Park Portsmouth Hampshire PO3 5TD England, U.K.
Contact Name:	Mr. P. Bowen, EMC Team leader

TEST REPORT No. 648/1064 Page 4 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 2 Equipment Under Test (EUT)

#### 2.1 Identification of Equipment Under Test (EUT)

Brand Name:	Raymarine	
Model Name or Number:	RD218 Analog 2kW 18inch Radome Scanner	
	Compatible with the Following Raymarine disp	olays
	E120 12 inch Ultra Bright Multifunction Naviga	tion Display
	E80 8 inch Ultra Bright Multifunction Navigatio	n Display
	C70 7 inch Multifunction Navigation Display	
	C80 8 inch Multifunction Navigation Display	
	C120 12 inch Multifunction Navigation Display	
Unique Type Identification:	RD218 2kW unit	E52065
	E120 12" Display	E02013
	E80 8" Display	E02011
	C120 12" Display	E02022
	C80 8" Display	E02020
	C70 7" Display	E02018
Serial Number:	Scanner Unit	EMC151205
	Display Unit (E120)	EMC041104b
Country of Manufacture:	Hungary	
FCC ID Number:	PJ5-AD2D-8P	
Date of Receipt:	15 <sup>th</sup> December 2005	

#### 2.2 Description of EUT

The equipment under test is an X-band marine radar intended for use on leisure craft and small workboats, and is comprised of:

Scanner Unit: 2kW X-band transmitter with an 18 inch Flare antenna.

Display Unit: 12 inch Ultra Bright Multifunction Navigation Display with chart reader and with Seatalk/alarm, NMEA, Video in/out, Seatalk 2, and Seatalk High speed bus interface ports.

#### 2.3 Modifications incorporated in EUT

The EUT has not been modified from what is described by the Model Name and Unique Type Identification stated above.

TEST REPORT No. 648/1064 Page 5 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

#### 2.4 Additional information related to Testing

Power Supply Requirement:	Nominal 12-32V DC supply	
Intended Operating Environment:	Leisure Marine & Small Workboats	
Weight:	218 Scanner: 6.5kg (14.3lbs)	
	Display 7.35kg (16.2lbs)	
Dimensions:	424 Scanner: 521mm dia x 247mm height	
	Display: w355.5mm x h264mm x d140mm	
Interface Ports:	Power	
	Seatalk / Alarm	
	Seatalk 2	
	Seatalk High Speed Bus	
	NMEA	
	Video In	
	Video Out	

## 2.5 Support Equipment

Support equipment used up to 2GHz

Item	Unique Type Identification & Serial Number
ST60 Multi Display	A22003 / EMC 101203b
C80 Display	E02020 / EMC 181103a
DSM 250 Sonar	E62007 / EMC031103e
B256 Sonar transducer	E66024
ST290 Data Display	E22056 / 430015

No support equipment was required to be used over 2GHz

No. 648/1064

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 3 Test Specification, Methods and Procedures

#### 3.1 Test Specification

Reference:	FCC Part 80: 1998 and FCC Part 2:1998
Title:	Code of Federal Regulations, Part 80 (47CFR): 1998 Stations in the maritime services Code of Federal Regulations, Part 2 (47CFR): 1998
	Frequency Allocations and radio treaty matters; general rules and regulations
Comments:	The test facility used for the radiated emissions portions of these tests is an alternative test site as described in ANSI C63.4-2001, being a 3m test range within a semi-anechoic chamber, with antenna height scanning from 1 – 4 metres and meeting the +/-4dB NSA criterion. It is registered with the FCC under the 2.948 (47CFR) listing procedure with Reference Number 970522.
Purpose of Test:	To demonstrate compliance of the RD218 analog 2kW radome scanner
	with the appropriate clauses of Parts 2 and 80 of the FCC Rules.

#### 3.2 Methods and Procedures

The methods and procedures used were as detailed in:

ANSI C63.2-1996

Title: American National Standard for Electromagnetic Noise and Field Strength Instrumentation, 10 Hz to 40 GHz – Specifications

ANSI C63.4-2001

Title: American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

ANSI C63.5-1998

Title: American National Standard for Electromagnetic Compatibility – Radiated Emission Measurements in Electromagnetic Interference (EMI) Control – Calibration of Antennas (9 kHz to 40 GHz)

CISPR 16-1 (1999)

Title: Specification for radio disturbance and immunity measuring apparatus and methods Part 1: Radio disturbance and immunity measuring apparatus

CISPR 16-4 (2002)

Title: Specification for radio disturbance and immunity measuring apparatus and methods Part 4: Uncertainty in EMC measurements

#### 3.3 Definition of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the Methods and Procedures section above. Appendix A contains a list of the test equipment used.

TEST REPORT No. 648/1064

Page 7 of 57 Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

#### 3.4 Facility FCC Registration

The EMC test facility is registered with the FCC under registration number 970552

TEST REPORT No. 648/1064 Page 8 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 4 Deviations from the Test Specification

None

TEST REPORT No. 648/1064 Page 9 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 5 Operation of the EUT during Testing

#### 5.1 Operating Conditions

- 1. Radiated Emissions, 9kHz to 40GHz: The EUT was located on a non-conducting support above a turntable on a 3m test range within a semi-anechoic chamber (Raymarine Site 3)
- 2. The EUT was located in a laboratory environment for all other tests.
- 3. During testing, the EUT was powered by a nominal 12V DC supply except when measuring Frequency Variation with Voltage. [FCC Part 2, 1055(d)]

#### 5.2 Operating Modes

The EUT was tested in the following operating modes:

- 1. Radiated emissions: Transmitting into a rotating non-reflective load with the transmitter set to 75, 450 and 1000ns pulse widths.
- 2. Conducted emissions: Transmitting into a fixed non-reflective load with the transmitter set to 75, 450 and 1000ns pulse widths.
- 3. Variation of transmit frequency with voltage and temperature: The transmitter was set to the half nautical mile range (75ns pulse width) and the six nautical mile range (1000ns pulse width).
- 4. Transmitter power, pulse width, occupied bandwidth and P.R.F. Transmitting into a fixed non-reflective load.

#### 5.3 Configuration and peripherals

- 1. The scanner unit was connected to the display unit with the standard cable of 15m length. A transmit dummy load was connected to the scanner unit antenna port. Over the frequency range 9kHz to 2GHz all interface ports were terminated with suitable instruments. Above 2GHz all display unit interface ports were connected to dummy loads using the maximum length of cable specified for the particular port, or 20 m where this is less than the maximum specified. A 12V DC supply was connected to the Display Unit.
- 2. This configuration is defined as being likely to be the worst case as regards emissions.
- 3. Appendix A of this report contains a full list of test equipment used and Appendix C contains a schematic diagram of the test configuration.

# 7 Measurements, Examinations and Derived Results

#### 7.1 General Comments

This section contains test results only. Details of the test methods and procedures can be found in Appendix B of this report.

Measurement uncertainties are stated in accordance with the requirements of CISPR 16-4:2002. Please refer to Section 8 for details of measurement uncertainties.

The highest frequency generated by the EUT is 9.4GHz. Consequently, tests were performed up to 40GHz.

#### 7.2 Field Strength Measurements

#### 7.2.1 Magnetic Field Measurements: Frequency Range 9 kHz to 30 MHz

Plots of measurements using a peak detector can be found in Appendix D.

No emissions exceeded a level of 70dBuV/m.

Details of the limit line calculation can be seen in Appendix B.

#### 7.2.2 Electric Field Measurements: Frequency Range 30 MHz to 2000 MHz

Plots of measurements can be found in Appendix D.

The highest peak levels measured were less than 60dBuv/m

Details of the limit line calculation can be seen in Appendix B

#### 7.2.3 Electric Field Measurements: Frequency Range: 2GHz to 40GHz

Plots of measurement scans can be found in Appendix D.

The following table lists frequencies at which significant emissions were measured using Peak detector functions. Although these emissions are not required to be recorded, being more than 20dB lower than the limit line, they are included for completeness as they are all magnetron-related.

Details of the limit line calculation can be seen in Appendix B

TEST REPORT No. 648/1064 Page 14 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

Frequency (GHz)	Antenna Polarization	Level (dBuV/m)	Limit (dBuV/m)	Margin (dB)	Result
18.790	Vertical	83.6	134.4	50.8	Complied
28.19	Vertical	103.5	134.4	30.9	Complied
37.48	Vertical	102.9	134.4	31.5	Complied

#### 7.3 Conducted Emissions

#### 7.3.1 Peak Detector measurements on RF port

The design of the RF coupling from the magnetron to the antenna forms an effective high pass/band pass filter arrangement. The peak energy level of radar requires considerable attenuation in order to prevent the analyser from going into compression. This limits the maximum dBc figure that can be obtained without changing the resolution bandwidth of the analyser. Since the signal is wideband compared to the resolution bandwidth, it is critical to the measurement accuracy that the resolution bandwidth settings remain consistent throughout the testing where possible.

Due to the use of waveguide on the antenna port, the lowest frequency of measurement was increased to 6GHz. The following table lists frequencies at which emissions or the highest noise floors were measured using a Peak Detector. Note that for measurements above 26.5GHz, the mixer conversion process may produce a "true" and "spurious" response for each signal, depending on which analyser local oscillator harmonic is selected. Only the true responses are detailed in the table below. These are clearly identifiable as harmonics of the magnetron frequency. Plots of the scans can be found in Appendix D.

Measurements were performed from 6 GHz to 40GHz with the EUT set to 75ns, 450nS and 1000ns, measurements were performed within and around the transmitter frequency allocation.

Details of the limit line calculation can be found in Appendix B.

All emissions were more than 20dB below the required limit.

TEST REPORT No. 648/1064 Page 15 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 7.4 Peak Power

These measurements were performed with the HP Peak Power Analyser and sensor connected to the EUT antenna port via a coupler and in-line attenuator.

Pulse Width (ns)	Measured Power (kW)
75	2.04
100	2.04
150	1.91
250	1.78
350	1.91
450	1.79
600	1.82
1000	1.82

#### 7.5 Pulse Width

Plots can be found in Appendix D.

In order to determine the characteristics of the various pulses, the HP Peak Power Analyser was connected to the EUT antenna port via a coupler and inline attenuator.

Nominal Pulse Width (ns)	Measured Pulse Width (ns)
75	77
100	102
150	153
250	252
350	358
450	460
600	618
1000	1010

TEST REPORT No. 648/1064 Page 16 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

#### 7.6 Pulse Repetition Frequency

In order to determine the characteristics of the various pulses, the HP Peak Power Analyser and sensor was connected to the EUT antenna port via a coupler and in-line attenuator.

Pulse Width (ns)	Measured P.R.F. (Hz)
75	2994
100	2994
150	2994
250	2500
350	1798
450	1405
600	998
1000	741

Note 1: The P.R.F. is jittered as part of the interference rejection circuit. The Interference Rejection circuit was switched off while making P.R.F. measurements.

#### 7.7 Average Power

Measured at the antenna port

Nominal Pulse Width (ns)	Peak Power (kW)	P.R.F. (Hz)	Measured Pulse Width (ns)	Average Power (Watts)
75	2.04	2994	77	0.47
100	2.04	2994	102	0.62
150	1.91	2994	153	0.87
250	1.78	2500	252	1.12
350	1.91	1798	358	1.23
450	1.79	1405	460	1.16
600	1.82	998	618	1.12
1000	1.82	741	1010	1.36

Note 1: The previous subsections detail the results required to make the above calculation.

TEST REPORT No. 648/1064 Page 17 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

#### 7.8 Variation of frequency with input voltage

The frequency of the EUT was measured at each voltage.

#### **75ns**

% of Nominal Volts	Volts (dc)	Measured Frequency (GHz)
85% of 12.0	10.2	9.419475
100% of 12.0	12.0	9.419388
100% of 32.0	32.0	9.419494
115% of 32.0	36.8	9.419263

#### 1000ns

% of Nominal Volts	Volts (dc)	Measured Frequency (GHz)
85% of 12.0	10.2	9.418988
100% of 12.0	12.0	9.418950
100% of 32.0	32.0	9.419000
115% of 32.0	36.8	9.419006

Note: The equipment can be operated from any voltage within the nominal range 12 to 32V without requiring any adjustment. Therefore, the testing was performed from 85% of the lowest to 115% of the highest operating voltage.

#### 7.9 Variation of frequency with temperature

The EUT scanner unit was situated in an environmental test chamber and set for normal operation at the shortest pulse width. The antenna port was connected via a coupler and inline attenuator to the input of the HP70000 analyser, which is equipped with a precision frequency reference module.

The chamber was then set to –20C. After a 30-minute delay to allow for temperature stabilisation, the EUT frequency was monitored until there was no measurable frequency change. The frequency was recorded. The EUT was then set for normal operation at the longest pulse width, and the frequency monitored until there was no measurable frequency change. The frequency was recorded.

The chamber temperature was then increased by 10C and the process repeated at this temperature and at further increments of 10C up to and including +50C.

\_\_\_\_\_

#### 7.10 Occupied Bandwidth

Plots can be found in Appendix D.

The 99.5% (-23dBc) power bandwidth was measured for each pulse width using the delta function of the HP70000 analyser. Owing to the shape of the pulse it was not always possible to measure the bandwidth at the exact –23db point. Consequently, the next lower point was taken. This has the effect of slightly increasing the measured bandwidth above the actual 99.5% bandwidth.

Nominal Pulse Width (ns)	99.5% Power Bandwidth (MHz)
75	49.70
100	43.29
150	32.87
250	24.05
350	20.84
450	20.44
600	20.04
1000	20.04

#### 7.11 Transmitter Frequency Tolerance

#### 7.11.1 Specification: 80.209(b)

"When pulse modulation is used in land and ship radar stations operating in the bands above 2.4GHz the frequency at which maximum emission occurs must be within the authorised bandwidth and must not be closer than 1.5/T MHz to the upper and lower limits of the authorised bandwidth where "T" is the pulse duration in microseconds."

600	618	9.30243	9.49757			
1000	1010	9.30149	9.49851			

From examining the transmitter frequency data from the Variation of Frequency with Voltage and Variation of Frequency with Temperature results pages, it can be seen that the transmitter is within the calculated specification.

TEST REPORT No. 648/1064 Page 21 of 57

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# 8 Measurement Uncertainty

Measurement uncertainty was calculated after reference to CISPR 16-4:2002. In order to determine compliance with the limit for emissions tests, the specification states that, where the calculated uncertainty exceeds the value of Ucispr, the difference in dB is to be added to the instrument reading. The corrections shown in the table below are therefore added to the reported measurements before assessing compliance with the limits.

Measurement Type	Confidence Level (k = 2)	Calculated Uncertainty	Ucispr	Correction
Radiated Emissions: Electric	95%	+/- 6.8dB	4.5dB(<300MHz)	+2.3dB(<300MHz)
Field Strength 30MHz-1GHz			5.2dB(>300MHz)	+1.6dB(>300MHz)
Radiated	95%	+/- 7.3dB	Under	+2.1dB
Emissions: Electric			consideration	
Field Strength			(5.2dB	
1GHz-26.5GHz			assumed)	
Radiated	95%	+/-7.6dB	Under	+2.4dB
Emissions: Electric			consideration	
Field Strength			(5.2dB	
26.5-40GHz			assumed)	

Note 1. All test equipment and antennae used for the tests described in this report have current traceable calibration to UKAS or equivalent standard.

Note 2. All reported measurements include the appropriate offsets for antenna factors, coupler and cable losses, etc.

Issue Date: 13th February, 2006

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

# **Test Equipment Used (continued)**

# Notes:

- 2 year calibration cycle in accordance with manufacturer's recommendations.
- \*\* 3 year calibration cycle in accordance with manufacturer's recommendations.
- \*\*\* Voltage monitored using Item 424

All test equipment, except cables, wave guide components and attenuators, are on a calibration cycle in accordance with UKAS requirements. Items marked calibration as required are calibrated during the test setup using the R&S microwave signal generator in conjunction with the H-P analyzer.

# Appendix B Measurement Methods.

#### B.1 Calculating Emissions Limit Lines

For both radiated emissions and conducted spurious emissions from the antenna port, with an Assigned Frequency of 9410MHz (Authorised Band 9310 - 9510MHz), the limits close to the magnetron frequency are:

Over the ranges 9210 - 9310MHz and 9510 - 9610MHz: -25dBc Over the ranges 8910 - 9210MHz and 9610 - 9910MHz: -35dBc

To establish the radiated emissions limit for the product on frequencies outside the range 8910 - 9910MHz, the EUT was placed on the test site with the measuring equipment located at a distance of three metres.

The magnetron was disconnected and replaced with a WG16 to N-type coaxial connector adaptor, which was connected to a signal generator with an unmodulated output at 9.4GHz. The rotating joint was connected, via an adaptor and attenuator, to a power meter and sensor.

The signal generator was unable to reproduce the actual peak power output of the intentional radiator – measured as 2.04kW by conducted methods. Consequently, a level of 2.04mW was reproduced at the antenna port, requiring a factor of +60dB to be applied at the analyser.

The rotating joint adaptor, attenuator and power measurement equipment were removed and replaced with the 18 inch Flare antenna. The antenna was aligned with the horn antenna connected to the spectrum analyser and adjusted to peak the analyser response. A reading of 178.9dBuV/m was obtained.

The calculation for the radiated emissions limit line is:

$$178.9 - 43 - 10\log_{10} 1.4 = 134.4 \text{ dBuV/m}$$

For conducted spurious emissions from the antenna port, the calculation to establish the limit line for frequencies outside the range 8910 - 9910MHz is:

Po(peak)dBm  $- 43 - 10log_{10}$  P(mean)watts, i.e.,  $63.03 - 43 - 10log_{10}$  1.4 = **18.57dBm** 

#### B.2 Radiated Emissions (9 kHz to 2 GHz)

Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for a Peak detector.

All testing was carried out within a semi-anechoic chamber at a distance of 3m. For all tests, the open array antenna was replaced with a rotating microwave load.

Measurements were split into five subranges to accommodate receiver bandwidth and antenna changes. Over each range, the same measurement procedure was used. The antenna was initially set to a height of 1.5m. The receiver was set to step through the appropriate frequency range in "Peak and Hold" mode, with the antenna firstly in vertical polarisation and then in horizontal polarisation. The EUT was then rotated clockwise through 90 degrees, then 180 degrees and finally 270 degrees, with the measurement process repeated at each 90 degree point, thus building up a profile of peak emissions. Emissions of

TEST REPORT No. 648/1064 Page 25 of 57

Test of: Raymarine Ltd.

RD218 Analog 2kW Radome Scanner

FCC Part 80: 1998 and FCC Part 2: 1998

significance were noted. For each of these emissions, the antenna polarisation was changed to give the higher reading; the turntable was then rotated through 360 degrees to find the area

of the EUT radiating the highest level and, for frequencies above 30MHz, the antenna height was then varied between 1 and 4m above the ground plane to further maximise the signal before remeasurement.

Measurements above 30MHz were performed using broadband antennas. Below 30MHz, a magnetic loop antenna was used.

#### B.3 Radiated Emissions 2 GHz to 6.5 GHz

Radiated emissions measurements were performed using a horn antenna, against appropriate limits for a Peak detector.

All testing was carried out within a semi-anechoic chamber at a distance of 3m. The conducting ground plane between the antenna and the EUT was covered with ferrite and pyramidal absorbing material. For all tests, the open array antenna was replaced with a rotating microwave load.

The horn antenna was set to a height of 1.5m. The analyser was set to sweep through the appropriate frequency range in "Max Hold" mode, with the antenna firstly in vertical polarisation and then in horizontal polarisation. The EUT was then rotated clockwise through 90 degrees, then 180 degrees and finally 270 degrees, with the measurement process repeated at each 90 degree point, thus building up a profile of peak emissions. Emissions of significance were noted. For each of these emissions, the antenna polarisation was changed to give the higher reading; the turntable was then rotated through 360 degrees to find the area of the EUT radiating the highest level.

#### B.4 Radiated Emissions 6.5 GHz to 40 GHz

Radiated emissions measurements were performed against appropriate limits for a Peak detector. All measurements were carried out using horn antennas.

All testing was carried out within a semi-anechoic chamber at a distance of 3m. The conducting ground plane between the antenna and the EUT was covered with ferrite and pyramidal absorbing material. For all tests, the open array antenna was replaced with a rotating microwave load.

Measurements were split into subranges to accommodate antenna and mixer changes. Over each range, the same measurement procedure was used. The antenna was set to a height of 1.5m. The analyser was set to sweep through the appropriate frequency range in "Max Hold" mode, with the antenna in vertical polarisation. The EUT was slowly rotated clockwise through 360 degrees and then back to 000 degrees, thus building up a profile of peak emissions. The antenna was then changed to horizontal polarisation and the process continued. Emissions of significance were noted. For each of these emissions, the antenna polarisation was changed to give the higher reading; the turntable was then rotated to find the area of the EUT radiating the highest level. Measurements within 20dB of the limit line were recorded.

# **Appendix C** Test Configuration Drawings

The scanner and display unit were arranged in as near a representative configuration as was practicable. The display unit, interface leads and excess scanner interconnection cable were placed upon a non-conducting support on the turntable such that the surface of the support was 0.8m above the ground plane. For tests below 2GHz, the scanner unit was placed centrally above the display unit on a non-conducting support 0.38m high. Above 1GHz, this support was increased to 0.5m, aligning the magnetron and circulator assembly height with the receiving horn antenna. The power lead was connected to a 12V power supply placed on the turntable; the screen of this cable was connected to the ground plane. The Seatalk, HSB and NMEA Out cables, were bundled with 0.4m loops and placed around the display unit. The scanner interconnection cable was coiled around the scanner support. Due to its size and construction, this cable cannot be bundled in the same manner as the other cables.
