Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

1. Client Information

Company Name:	Raymarine Ltd.
Address:	Anchorage Park Portsmouth Hants PO3 5TD
Contact Name:	Mr C Bird

2. Equipment Under Test (EUT)

The following information (with the exception of the Date of Receipt) has been supplied by the client:

2.1. Identification Of Equipment Under Test (EUT)

Brand Name:	Raymarine
Model Name or Number:	2D
Unique Type Identification:	M92650
Serial Number:	None Stated by Client
Country of Manufacture:	UK
FCC ID Number:	PJ5MTX2-8P
Date of Receipt:	22 August 2001

2.2. Description Of EUT

The EUT is a light marine raydome scanner unit with a 2kW peak power transmitter and a 18 inch antenna. The scanner unit can be connected to one of a series of display unit variants. The display unit used during the testing contained in this test report was a RL70RC PLUS 7 inch mono LCD display.

The radar system designation is RL72CRC PLUS.

2.3. Modifications Incorporated In EUT

Preliminary radiated field strength measurements resulted in a modification that will be incorporated in all 2D radar scanner units. The modification consists of a screening can containing RAM being placed around the magnetron.

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

2.4. Additional Information Related To Testing

Power Supply Requirement:	12V DC Supply
Intended Operating Environment:	Leisure Marine and workboats
Weight:	8 kg
Dimensions:	500 mm diameter x 200 mm height
Interface Ports:	13-pin scanner 3-pin DC power 3-pin SeaTalk data; 3-pin hsb ² (high speed bus) 4-pin NMEA OUT

2.5. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	7" Mono LCD Radar/Chart Display Unit
Brand Name:	Raymarine
Model Name or Number:	RL70RC PLUS
Serial Number:	None
FCC ID Number:	N/A
Cable Length And Type:	Dedicated 15 meter Cable
Connected to Port:	Dedicated Port

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

3. Test Specification, Methods & Procedures**3.1. Test Specification**

Reference:	FCC Part 80 Subpart E: 1998 and FCC Part 2: 1998
Title:	Code of Federal Regulations, Part 80 (47CFR): 1998 Stations in the maritime services Subpart E: General Technical Standards Code of Federal Regulations, Part 2 (47CFR): 1998 Frequency Allocations and radio treaty matters; general rules and regulations
Comments:	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
Purpose of Test:	To determine whether the equipment complied with the requirements of the specification for the purposes of verification.

3.2. Methods And Procedures

The methods and procedures used were as detailed in:

ANSI C63.2 (1987)

Title: American National Standard for Instrumentation - Electromagnetic noise and field strength.

ANSI C63.4 (1992)

Title: American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

ANSI C63.5 (1988)

Title: American National Standard for the Calibration of antennas used for Radiated Emission measurements in Electromagnetic Interference (EMI) control.

ANSI C63.7 (1988)

Title: American National Standard Guide for Construction of Open Area Test Sites for performing Radiated Emission Measurements.

CISPR 16 (1987)

Title: Specification for Radio Interference measuring apparatus and measurement methods.

3.3. Definition Of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the Methods & Procedures section above. Appendix 1 contains a list of the test equipment used.

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

4. Deviations From The Test Specification

2.1047(d) Modulation characteristics – *Other types of equipment*. No curves supplied.

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

5. Operation Of The EUT During Testing

5.1. Operating Conditions

9kHz to 40GHz: The EUT was located in a covered turntable site on the 3m open area test site environment for radiated emissions.

The EUT was located in a laboratory environment for all other tests.

During testing, the EUT was powered by a Nominal 12V dc supply.

5.2. Operating Modes

The EUT was tested in the following operating modes:

Radiated emissions: Transmitting into a non-reflective load with the transmitter set to a 450ns pulse width, 1.4kHz PRF. In the frequency band near the assigned frequency band the transmitter was also set to pulse widths of 6.5ns and 1000ns.

This mode was defined by the client as being likely to be the worst case with regards to EMC.

Variation of transmit frequency with voltage and temperature: The transmitter was set to the half nautical mile range and the six nautical mile range, 65ns and 1000ns pulse width.

For other testing, the pulse widths were: 65ns (0.25 mile range), 90ns (0.5 mile range), 150ns (0.75 mile range), 250ns (0.75 mile range expanded), 350ns (1.5 mile range), 450ns (3 mile range), 600ns (3 mile range expanded), 1000ns (6 mile range).

5.3. Configuration And Peripherals

The EUT was tested in the following configuration:

The Scanner Unit was connected to the Display Unit with cable of a standard 15 m length. A dummy load was connected to the Scanner Unit antenna port. All Display Unit interface ports were connected via dummy loads. A 12 V DC supply was connected to the Display Unit.

This mode was defined by the client as being likely to be the worst case with regards to emissions.

Appendix 1 of this report contains a full list of test equipment used and Appendix 2 contains a schematic diagram of the test configuration.

6. Summary Of Test Results**6.1. Summary Of Tests****6.1.1. Radiated Spurious Emissions**

Frequency Range	Specification Reference	Compliance Status
9kHz to 40GHz	80.211(f) and 2.1053	Complied

6.1.2. Conducted Spurious Emissions

Frequency Range	Specification Reference	Compliance Status
9KHz to 40GHz	80.211(f) and 2.1051	Complied

6.1.3. RF Power Output**6.1.3.1. Peak Power**

Nominal Pulse Width Range (ns)	Specification Reference	Compliance Status
65 to 1000	80.215(a) and 2.1046(a)	Complied

6.1.3.2. Average Power

Nominal Pulse Width Range (ns)	Specification Reference	Compliance Status
65 to 1000	80.215(a) and 2.1046(a)	Complied

6.1.3.3. Pulse Width

Nominal Pulse Width Range (ns)	Specification Reference	Compliance Status
65 to 1000	80.215(a) and 2.1046(a)	Complied

6.1.3.4. PRF

Pulse Repetition frequency (Khz)	Specification Reference	Compliance Status
3.0 to 0.74	80.213(g) and 2.1047(d)	Complied

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

6.1.4. Variation of Frequency with Voltage**6.1.4.1. 65ns**

Nominal Pulse Width (ns)	Specification Reference	Compliance Status
65	2.1055(d)	Complied

6.1.4.2. 1000ns

Nominal Pulse Width (ns)	Specification Reference	Compliance Status
1000	2.1055(d)	Complied

6.1.5. Variation of Frequency with Temperature**6.1.5.1.65ns**

Nominal Pulse Width (ns)	Specification Reference	Compliance Status
65	2.1055(a and b)	Complied

6.1.5.2.1000ns

Nominal Pulse Width (ns)	Specification Reference	Compliance Status
1000	2.1055(a and b)	Complied

6.1.6. Occupied Bandwidth

Nominal Pulse Width Range (ns)	Specification Reference	Compliance Status
65 to 1000	2.1049(i) and 80.205(a)	Complied

6.1.7. Transmitter Frequency Tolerance

Nominal Pulse Width Range (ns)	Specification Reference	Compliance Status
65 to 1000	80.209(b)	Complied

6.1.8. Suppression of Interference Aboard Ships

80.217. When the radar is in standby mode of operation, the local oscillator is automatically switched off.

6.2. Location Of Tests

All the measurements described in this report were performed at the premises of Radio Frequency Investigation Ltd, Ewhurst Park, Ramsdell, Basingstoke, Hampshire, RG26 5RQ, England.

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7. Measurements, Examinations And Derived Results

7.1. General Comments

7.1.1. This section contains test results only. Details of the test methods and procedures can be found in Appendix 2 of this report.

7.1.2. The measurement uncertainties stated were calculated in accordance with the requirements of NAMAS Document NIS 81 with a confidence level of 95%. Please refer to Section 8 for details of measurement uncertainties.

7.1.3. The client declared the highest clock frequency of the EUT as 9.41GHz. Consequently, the tests were performed up to 40GHz.

7.1.4. With reference to GPH/42598/02/02/023 which shows a failure of the antenna port conducted emissions at a frequency of 18.7948GHz. It should be noted that this harmonic emission level was due to the lack of fundamental carrier signal attenuation. However a waveguide with a low end cut off frequency of approximately 14 GHz was used to perform a repeat measurement. Therefore, the level on the scan does not constitute the final result. This measurement can be found in table 7.3.1 of this report.

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.2. Field Strength Measurements**7.2.1. Magnetic Field Strength Measurements (Frequency Range: 9kHz to 30MHz)**

7.2.1.1. Please refer to Appendix 4 of this test report for graphical results.

7.2.1.2. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector (The results incorporate antenna factors and cable losses):

Frequency (MHz)	Ant. Pol.	Q-P Level (dBmV/m)	Limit (dBmV/m)	Margin (dB)	Result
0.0968	0°	66.7	104.0	37.3	Pass
0.1955	0°	55.2	104.0	48.8	Pass

7.2.2. Electric Field Strength Measurements (Frequency Range: 30MHz to 1GHz)

7.2.2.1. Please refer to Appendix 4 of this test report for graphical results.

7.2.2.2. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector (The results incorporate antenna factors and cable losses):

Frequency (MHz)	Ant. Pol.	Q-P Level (dBmV/m)	Limit (dBmV/m)	Margin (dB)	Result
114.016	H	50.2	104.0	53.8	Pass
133.019	H	43.2	104.0	60.8	Pass
525.782	H	36.3	104.0	67.7	Pass
529.895	H	37.2	104.0	66.8	Pass
544.546	H	37.1	104.0	66.9	Pass

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.2.3. Electric Field Strength Measurements (Frequency Range: 1GHz to 40GHz)

7.2.3.1. The client declared the highest clock frequency of the EUT as 9.41GHz. Consequently, the tests were performed up to 40GHz.

7.2.3.2. Please refer to Appendix 4 of this test report for graphical results.

7.2.3.3. The following tables list frequencies at which emissions were measured using Peak detector functions.

Highest Peak Level:

Frequency Span Range (GHz)	Actual Peak Level (dBmV/m)	Peak Limit (dBmV/m)	Margin (dB)	Result
1.0 to 2.0	<66.2	104.0	37.8	Pass
2.0 to 4.0	<63.1	104.0	40.9	Pass
4.0 to 6.0	<70.5	104.0	33.5	Pass
6.0 to 8.0	<71.3	104.0	32.7	Pass
8.0 to 12.0	<86.8	104.0	17.2	Pass
12.0 to 18.0	<77.9	104.0	26.1	Pass
18.0 to 26.5	<87.7	104.0	16.3	Pass
26.5 to 33.0	<93.2	104.0	10.8	Pass
33.0 to 40.0	<99.0	104.0	5.0	Pass

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.3. Conducted Emissions**7.3.1. Peak Detector Measurements On RF port**

7.3.1.1. Please refer to Appendix 4 of this test report for graphical results.

7.3.1.2. The following table lists frequencies at which emissions or the highest noise floor were measured using a Peak detector:

Frequency (GHz)	Level (dBm)	Limit (dBm)	Margin (dB)	Result
6 to 8.910	-20.4	-13.0	7.4	Complied
8.910 to 9.210	-3.8	28.3	27.3	Complied
9.210 to 9.310	4.8	38.3	33.5	Complied
9.510 to 9.610	-8.2	38.3	46.5	Complied
9.610 to 9.910	-8.2	28.3	36.5	Complied
9.910 to 26.5	-13.4	-13.0	0.4	Complied
26.5 to 40.0	-20.0	-13.0	7.0	Complied

Note 1: Due to the use of waveguide WR90 at the antenna port of the EUT, which has a cut-off frequency of 6.57GHz, the lower frequency of measurement was increased to 6.0GHz

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.4. Average Power Summary.

Nominal Pulse Width (ns)	Measured Peak Power (W)	Measured P.R.F (kHz)	Measured Pulse Width (ns)	Calculated Average Power (Watts)
65	1503	3.058	66.267	0.305
90	1875	3.058	97.804	0.558
150	2032	3.058	150.699	0.936
250	2286	2.488	248.503	1.413
350	2410	1.798	347.305	1.505
450	2489	1.401	455.090	1.587
600	2559	1.004	596.806	1.533
1000	2254	0.740	998.004	1.665

Note 1: The following sub sections detail the results required to make the above calculation.

Note 2: Example of calculation used to derive the Calculated Average Power.
Peak Power(Watts) X Pulse Width(Seconds) X PRF(Hz) = Average Power(Watts).
Eg. $1503 \times 3058 \times 66.267^{-9} = 0.305$

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.4.1. Peak Power

7.4.1.1. These measurements were performed with the HP Power Analyser and sensor connected to the EUT via a coupler, in line Attenuator and microwave coax cable.

Pulse Width (ns)	Measured Power (dBm)	Corrected Power, Peak (kW)
65	61.77	1.503
90	62.73	1.875
150	63.08	2.032
250	63.59	2.286
350	63.82	2.410
450	63.96	2.489
600	64.08	2.559
1000	63.53	2.254

Note 1: The power at the shorter pulse widths has been deliberately reduced to enhance radar performance.

7.4.2. Pulse width

7.4.2.1. Please refer to Appendix 4 of this test report for graphical results.

7.4.2.2. In order to determine the characteristics of the various pulses, a power analyser was connected, through a HP detector and an attenuator to the test set up.

Nominal Pulse Width (ns)	Measured Pulse Width (ns)
65	66.267
90	97.804
150	150.699
250	248.503
350	347.305
450	455.090
600	596.806
1000	998.004

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.4.3. PRF

7.4.2.1. Please refer to Appendix 4 of this test report for graphical results.

7.4.3.2. In order to determine the characteristics of the various pulses, a power analyser was connected, through a HP detector and an attenuator to the test set up.

Pulse Width (ns)	Measured P.R.F. (kHz)
65, 90 & 150	3.058
250	2.488
350	1.798
450	1.401
600	1.004
1000	0.740

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.5. Variation of frequency with voltage

7.5.1. Please refer to Appendix 4 of this test report for graphical results.

7.5.2. The frequency of the EUT was measured at each voltage.

7.5.3. The equipment can be operated from 12 or 24 Volts sources without requiring any changes. Therefore the testing was performed at 85 % of the lowest to 115 % of the highest operating Voltage

65ns

% of nominal Volts	Volts (dc)	Measured frequency (MHz)	Deviation from 9410 MHz (MHz)
85 (12V)	10.2	9393.3	-16.7
100 (12V)	12.0	9394.0	-16.0
100 (24V)	24.0	9384.4	-25.6
115 (24V)	27.6	9393.1	-16.9

1000ns

% of nominal Volts	Volts (dc)	Measured frequency (MHz)	Deviation from 9410 MHz (MHz)
85 (12V)	10.2	9385.1	-24.9
100 (12V)	12.0	9386.0	-24.0
100 (24V)	24.0	9386.2	-23.8
115 (24V)	27.6	9386.2	-23.8

Note 1: The Battery End Point is 10.2 Volts.

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.6. Variation of frequency with Temperature

7.6.1. The EUT was situated in an environmental test chamber. Initially the EUT remained off. The chamber was set to $-20\text{ }^{\circ}\text{C}$. After a minimum of 30 minutes the EUT was turned on and allowed to stabilise until there was no measurable frequency change. The frequency was recorded. The EUT was then switched off, and the chamber temperature stepped up by $10\text{ }^{\circ}\text{C}$. This process was repeated until the EUT was at $+50\text{ }^{\circ}\text{C}$.

60ns Pulse

Temperature $^{\circ}\text{C}$	Measured frequency (MHz)	Deviation from 9410 MHz (MHz)
-20	9400.2	+9.8
-10	9398.5	-11.5
0	9399.2	-10.8
+10	9396.6	-13.4
+20	9394.5	-15.5
+30	9394.1	-15.9
+40	9398.3	-11.7
+50	9388.7	-21.3

1000ns Pulse

Temperature $^{\circ}\text{C}$	Measured frequency (MHz)	Deviation from 9410 MHz (MHz)
-20	9391.2	-18.8
-10	9391.6	-18.4
0	9390.8	-19.2
+10	9388.9	-21.1
+20	9388.1	-21.9
+30	9386.2	-23.8
+40	9385.5	-24.5
+50	9385.7	-24.3

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.7. Occupied Bandwidth

7.7.1. Please refer to Appendix 4 of this test report for graphical results.

7.7.2. The 99.5% power bandwidth was measured for each pulse mode using the special function option on the spectrum analyser.

Nominal Pulse Width (ns)	99.5% Power Bandwidth (MHz)
65	77.496
90	63.496
150	41.007
250	29.274
350	21.885
450	19.018
600	13.657
1000	11.493

Conformance Testing Department

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

7.8. Transmitter Frequency Tolerance

7.8.1.Specification: 80.209 (b) – “When pulse modulation is used in land and ship radar stations operating in the bands above 2.4GHz the frequency at which maximum emission occurs must be within the authorised bandwidth and must not be closer than **1.5/T MHz** to the upper and lower limits of the authorised bandwidth where “T” is the pulse duration in microseconds.”

7.8.2. Calculation

Authorised Bandwidth: 9300MHz to 9500MHz
Specification Limits [Lower] 9300 + 1.5/T
[Upper] 9500 - 1.5/T

Transmitter Frequency Tolerances FCC ID PJ5MTX4-8P			
Nominal Pulse Width (ns)	Actual Pulse Width (µs)	Specification Limits (MHz)	
		Lower	Upper
65	0.066267	9322.64	9477.36
90	0.097804	9315.34	9484.66
150	0.150699	9309.95	9490.05
250	0.248503	9306.04	9493.96
350	0.347305	9304.32	9495.68
450	0.455090	9303.30	9496.70
600	0.596806	9302.51	9497.49
1000	0.998004	9301.50	9498.97

From examining the transmitter frequency data from Variation of Frequency with Voltage and Variation of Frequency with Temperature results pages, it can be seen that the transmitter is within the calculated specification.

Test Of: Raymarine Ltd.
2D Light Marine Radome Radar Scanner
To: FCC Part 80: 1998 and FCC Part 2: 1998

8. Measurement Uncertainty

8.1. Company Policy, as based on the NAMAS Accreditation Standard, M10, paragraph 12.11 (o), states that Test Reports shall include estimated uncertainty of the calibration or test result (this information need only appear in test reports and test certificates where it is relevant to the validity or application of the test result, where a client's instructions so require or where uncertainty affects compliance to a specification or limit).

8.2. The global uncertainties have been calculated in accordance with NAMAS NIS 81 (Edition 1, May 1994) as follows:

Measurement Type	Range	Confidence Level	Calculated Uncertainty
Conducted Power	1 GHz to 40 GHz	95%	+/- 0.5 dB
Frequency Accuracy	N/A	95%	+/- 0.8 ppm
Radiated Emissions at 3.0 metres	30 MHz to 1000 MHz	95%	+/- 5.26 dB
Radiated Emissions at 10.0 metres	30 MHz to 1000 MHz	95%	+/- 5.1 dB
Radiated Emissions	1 GHz to 40 GHz	95%	+/- 4.18 dB

8.3. Measurement uncertainties have been applied in accordance with UKAS document NIS 81 (edition 1, May 1994), and in the absence of any specification criteria, guidance, or code of practice, compliance has been judged on the basis of shared risk.

8.4. In the case of emissions tests, the measured value of the disturbance from the product sample shall be compared directly with the limits. If the measured value is equal to or less than the limit the product is deemed to pass the test.

8.5. In the case of immunity tests, the equipment is deemed to pass the test if it fulfils the stated performance criteria at the required or a higher severity level. The measurement uncertainty has been taken into account in the calibration procedures stated in the relevant basic standard.

8.6. The methods used to calculate the above uncertainties are in line with those used for calibration laboratories contained in NAMAS document NIS 3003 Edition 8 "The Expression of Uncertainty and Confidence in Measurement" May 1995, which align with international recommendations "Guide to the Expression of Uncertainty in Measurement" ISO/IEC/OIML/BIPM (Prepared by ISO/TAG 4: January 1993).

Appendix 2. Measurement Methods

A2.1. Radiated Emissions [9 kHz to 1 GHz]

A2.1.1. Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for a Peak detector.

A2.1.2. Initial measurements covering the entire measurement band in the form of swept scans in a shielded enclosure were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which the EUT should be re-measured in full on the open area test site. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

A2.1.3. The initial scans were performed using an antenna height of 1.5 m and a measurement distance of 3 m. Following the initial scans, graphs were produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 20 dB below the specification limit and levels above the tolerance line were re-tested on the open area test site, at the appropriate distance, using a measuring receiver with a Peak detector.

A2.1.4. For the main (final) measurements the EUT was arranged on a non-conducting table on an open area test site, as detailed in the specification.

A2.1.5. All measurements on the open area test site were performed using broadband antennas.

A2.1.6. On the open area test site, at each frequency where a signal was found, the levels were maximised by initially rotating the turntable through 360° and then varying the antenna height between 1 m and 4 m. At this point, any signals found to be between the limit and a level 6 dB below it were further maximised by changing the configuration of the EUT, e.g. re-routing cables to peripherals and moving peripherals with respect to the EUT.

A2.2. Radiated Emissions [1 GHz to 95 GHz]

A2.2.1 Calculating Radiated Emissions Limit Line

A2.2.1. In defining the 104.0dBuV/m limit for the product, it was placed on the open area test site table with the measuring equipment located at a distance of three metres.

A2.2.2. The open array antenna was fitted as representative of normal operation and the magnetron disconnected. The magnetron was replaced with a waveguide to coaxial adaptor and connected to a signal generator.

A2.2.3. The signal generator was unable to reproduce the actual peak power output of the intentional radiator – measured as 2.559kW by conducted methods. Consequently, a level of 2.559mW was reproduced at the antenna port and the level on the spectrum analyser offset by +60dB.

A2.2.4. The non-reflective load was then connected to the transmitter system and the substitution measurement performed.
