Radio frequency hazard

Regulation

15.247(i) Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines. The limit for Maximum Permissible Exposure (MPE) specified in FCC 1.1310

Test result

MPE calculation to the FCC ID: PJMECCOPLUS

These equations are generally accurate in the far field of an antenna but will over predict power density in the near field, where they could be used for making a "worst case" prediction.

$$S = PG/4\pi R^2$$
 or $S = EIRP/(4\pi R^2)$

Where

S = power density (in appropriate units, e.g. mW/cm²)

P = power input to the antenna (in appropriate units e.g. mW)

G = power gain of the antenna in the direction of interest relative to the isotropic radiator

 \mathbf{R} = distance to the center of radiation of the antenna (appropriate units e.g. cm)

EIRP = equivalent isotropically radiated power

Calculation:

Radio frequency hazard								
802.11b								
Max. EIRP		Distance	Calculated Power Density	Limit	Margin			
dBm	mW	cm	mW / cm ²	mW / cm ²	mW / cm ²			
17.81	60.39	20	0.0120	1.0	0.988			
*Limit: the reference level for general public exposure according to the OFT Bulletin 65, edition 97-01 Table 1								

*Limit: the reference level for general public exposure according to the OET Bulletin 65, edition 97-01 Table 1. and according to FCC 1.1307 (b)

Radio frequency hazard								
802.11g								
Max. EIRP		Distance	Calculated Power Density	Limit	Margin			
dBm	mW	cm	mW / cm ²	mW / cm ²	mW / cm ²			
15.82	38.19	20	0.0076	1.0	0.992			
*Limit: the reference level for general public exposure according to the OET Bulletin 65, edition 97-01 Table 1								

The antenna of this product, under normal use condition, is at least 20cm away from the body of the user. Warning statement to the user for keeping at least 20cm separation distance from the antenna should be included in the User manual. So the device is classified as Mobile device.
