#### **Accredited Testing Laboratory:**

The testing laboratory (area of testing) is accredited according to DIN EN ISO/IEC 17025 (2018-03) by the Deutsche Akkreditierungsstelle GmbH

The accreditation is valid for the scope of testing procedures as stated in the accreditation certificate with the registration number:

D-PL-12047-01-00.

Radio Labs

ISED Testing Laboratory Recognized Listing Number: DE0001

FCC designation number: DE0002

For further applied test standards please refer to section 3 of this test report.

**Test Item** 

Kind of test item: Mobile Wireless Unit 2G4

Model name: TST FSAM-C
FCC ID: PJMTSTFSAMC
ISED certification number: 6633A-TSTFSAMC

Frequency: 2400 MHz to 2483.5 MHz
Technology tested: Proprietary 2G4 technology

Antenna: Integrated antenna
Power supply: 3.6 V DC by battery
Temperature range: -40°C to +70°C

This test report is electronically signed and valid without handwritten signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

### 2 General information

### 2.1 Notes and disclaimer

The test results of this test report relate exclusively to the test item specified in this test report. cetecom advanced GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of cetecom advanced GmbH.

The testing service provided by cetecom advanced GmbH has been rendered under the current "General Terms and Conditions for cetecom advanced GmbH".

cetecom advanced GmbH will not be liable for any loss or damage resulting from false, inaccurate, inappropriate or incomplete product information provided by the customer.

Under no circumstances does the cetecom advanced GmbH test report include any endorsement or warranty regarding the functionality, quality or performance of any other product or service provided.

Under no circumstances does the cetecom advanced GmbH test report include or imply any product or service warranties from cetecom advanced GmbH, including, without limitation, any implied warranties of merchantability, fitness for purpose, or non-infringement, all of which are expressly disclaimed by cetecom advanced GmbH.

All rights and remedies regarding vendor's products and services for which cetecom advanced GmbH has prepared this test report shall be provided by the party offering such products or services and not by cetecom advanced GmbH.

In no case this test report can be considered as a Letter of Approval.

This test report is electronically signed and valid without handwritten signature. For verification of the electronic signatures, the public keys can be requested at the testing laboratory.

# 4 Reporting statements of conformity – decision rule

Only the measured values related to their corresponding limits will be used to decide whether the equipment under test meets the requirements of the test standards listed in chapter 3.

The measurement uncertainty is mentioned in this test report, see chapter 9, but is not taken into account - neither to the limits nor to the measurement results. Measurement results with a smaller margin to the corresponding limits than the measurement uncertainty have a potential risk of more than 5% that the decision might be wrong."

## 6.2 Additional information

The content of the following annexes is defined in the QA. It may be that not all of the listed annexes are necessary for this report, thus some values in between may be missing.

Test setup and EUT photos are included in test report: 1-7789-24-02-01\_TR1-A101-R01 1-7789-24-02-01\_TR1-A102-R01

© cetecom advanced GmbH Page 6 of 35

## 7 Sequence of testing

# 7.1 Sequence of testing radiated spurious 9 kHz to 30 MHz

#### **Setup**

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, it is placed on a table with 0.8 m height.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) see test details.
- EUT is set into operation.

#### Premeasurement\*

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna height is 1 m.
- At each turntable position the analyzer sweeps with positive-peak detector to find the maximum of all emissions.

#### Final measurement

- Identified emissions during the pre-measurement are maximized by the software by rotating the turntable from 0° to 360°.
- Loop antenna is rotated about its vertical axis for maximum response at each azimuth about the EUT.
   (For certain applications, the loop antenna plane may also need to be positioned horizontally at the specified distance from the EUT)
- The final measurement is done in the position (turntable and elevation) causing the highest emissions with quasi-peak (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, correction factor, margin to the limit and limit will be recorded. A plot with the graph of the premeasurement and the limit is stored.

© cetecom advanced GmbH Page 7 of 35

<sup>\*)</sup>Note: The sequence will be repeated three times with different EUT orientations.

## 7.2 Sequence of testing radiated spurious 30 MHz to 1 GHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a table with 0.8 m height is used, which is placed on the ground plane.
- If the EUT is a floor standing device, it is placed on the ground plane with insulation between both.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 10 m or 3 m (see ANSI C 63.4) see test details.
- EUT is set into operation.

### **Premeasurement**

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height changes from 1 m to 3 m.
- At each turntable position, antenna polarization and height the analyzer sweeps three times in peak to find the maximum of all emissions.

#### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximize the peaks by changing turntable position ± 45° and antenna height between 1 and 4 m.
- The final measurement is done with quasi-peak detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, antenna height, antenna polarization, turntable angle, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

© cetecom advanced GmbH Page 8 of 35

# 7.3 Sequence of testing radiated spurious 1 GHz to 18 GHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- If the EUT is a tabletop system, a 2-axis positioner with 1.5 m height is used.
- If the EUT is a floor standing device, it is placed directly on the turn table.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet below the turntable.
- Measurement distance is 3 m (see ANSI C 63.4) see test details.
- EUT is set into operation.

#### **Premeasurement**

- The turntable rotates from 0° to 315° using 45° steps.
- The antenna is polarized vertical and horizontal.
- The antenna height is 1.5 m.
- At each turntable position and antenna polarization the analyzer sweeps with positive peak detector to find the maximum of all emissions.

#### Final measurement

- The final measurement is performed for at least six highest peaks according to the requirements of the ANSI C63.4.
- Based on antenna and turntable positions at which the peak values are measured the software maximizes the peaks by rotating the turntable from 0° to 360°. This measurement is repeated for different EUT-table positions (0° to 150° in 30°-steps) and for both antenna polarizations.
- The final measurement is done in the position (turntable, EUT-table and antenna polarization) causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, turntable position, EUT-table position, antenna polarization, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement with marked maximum final results and the limit is stored.

© cetecom advanced GmbH Page 9 of 35

## 7.4 Sequence of testing radiated spurious above 18 GHz

#### Setup

- The equipment is set up to simulate normal operation mode as described in the user manual or defined by the manufacturer.
- Auxiliary equipment and cables are positioned to simulate normal operation conditions as described in ANSI C 63.4.
- The AC power port of the EUT (if available) is connected to a power outlet.
- The measurement distance is as appropriate (e.g. 0.5 m).
- The EUT is set into operation.

#### **Premeasurement**

• The test antenna is handheld and moved carefully over the EUT to cover the EUT's whole sphere and different polarizations of the antenna.

#### Final measurement

- The final measurement is performed at the position and antenna orientation causing the highest emissions with Peak and RMS detector (as described in ANSI C 63.4).
- Final levels, frequency, measuring time, bandwidth, correction factor, margin to the limit and limit are recorded. A plot with the graph of the premeasurement and the limit is stored.

© cetecom advanced GmbH Page 10 of 35

# 8 Description of the test setup

Typically, the calibrations of the test apparatus are commissioned to and performed by an accredited calibration laboratory. The calibration intervals are determined in accordance with the DIN EN ISO/IEC 17025. In addition to the external calibrations, the laboratory executes comparison measurements with other calibrated test systems or effective verifications. Weekly chamber inspections and range calibrations are performed. Where possible, RF generating and signaling equipment as well as measuring receivers and analyzers are connected to an external high-precision 10 MHz reference (GPS-based or rubidium frequency standard).

In order to simplify the identification of the equipment used at some special tests, some items of test equipment and ancillaries can be provided with an identifier or number in the equipment list below (Lab/Item).

Each block diagram listed can contain several test setup configurations. All devices belonging to a test setup are identified with the same letter syntax. For example: Column Setup and all devices with an A.

### Agenda: Kind of Calibration

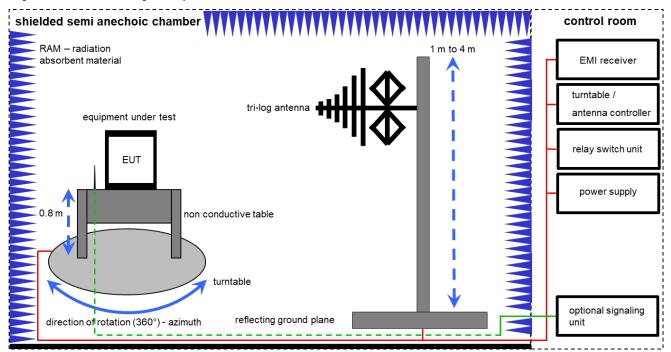

| k     | calibration / calibrated                   | EK  | limited calibration                              |
|-------|--|-----|--|
| ne    | not required (k, ev, izw, zw not required) | ZW  | cyclical maintenance (external cyclical          |
|       |  |     | maintenance)                                     |
| ev    | periodic self verification                 | izw | internal cyclical maintenance                    |
| Ve    | long-term stability recognized             | g   | blocked for accredited testing                   |

| NK!   | Attention: not calibrated                  | *)  | next calibration ordered / currently in progress |

© cetecom advanced GmbH Page 11 of 35

### 8.1 Shielded semi anechoic chamber

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 30 MHz to 1 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are conform to specifications ANSI C63. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analyzers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.

Measurement distance: tri-log antenna 10 meter; EMC32 software version: 10.59.00

FS = UR + CL + AF

(FS-field strength; UR-voltage at the receiver; CL-loss of the cable; AF-antenna factor)

#### Example calculation:

FS  $[dB\mu V/m] = 12.35 [dB\mu V/m] + 1.90 [dB] + 16.80 [dB/m] = 31.05 [dB\mu V/m] (35.69 \( \mu V/m \))$

# 8.2 Shielded fully anechoic chamber

Measurement distance: horn antenna 3 meter; loop antenna 3 meter / 1 meter

FS = UR + CA + AF

(FS-field strength; UR-voltage at the receiver; CA-loss of the signal path; AF-antenna factor)

### Example calculation:

FS  $[dB\mu V/m] = 40.0 [dB\mu V/m] + (-35.8) [dB] + 32.9 [dB/m] = 37.1 [dB\mu V/m] (71.61 \( \mu V/m \))$

### 8.3 Radiated measurements > 18 GHz

Measurement distance: horn antenna 50 cm

FS = UR + CA + AF

(FS-field strength; UR-voltage at the receiver; CA-loss signal path & distance correction; AF-antenna factor)

### Example calculation:

FS  $[dB\mu V/m] = 40.0 [dB\mu V/m] + (-60.1) [dB] + 36.74 [dB/m] = 16.64 [dB\mu V/m] (6.79 \( \mu V/m \))$

# 8.4 Conducted measurements system

OP = AV + CA

(OP-output power; AV-analyzer value; CA-loss signal path)

# Example calculation:

OP [dBm] = 6.0 [dBm] + 11.7 [dB] = 17.7 [dBm] (58.88 mW)

# 12 Measurement results

# 12.1 Maximum carrier field strength

# **Description:**

Measurement of the carrier field strength @ 3-meter distance with peak and average detector.

| Measurement parameters  |                                     |  |  |
|-------------------------|-------------------------------------|--|--|
| Detector                | Peak / AVG or duty cycle correction |  |  |
| Sweep time              | Auto                                |  |  |
| Resolution bandwidth    | 3 MHz                               |  |  |
| Video bandwidth         | 10 MHz                              |  |  |
| Span                    | 5 MHz                               |  |  |
| Trace mode              | Max hold                            |  |  |
| Test setup              | See sub clause 8.2 B                |  |  |
| Measurement uncertainty | See sub clause 9                    |  |  |

### Limits:

| FCC   | ISED |  |  |  |
|---|------|--|--|--|
| The field strength of emissions of intentional radiators shall comply with the following:<br>Field strength of fundamental: |      |  |  |  |
| 50 mV/m / (94 dBμV/m) @ 3 m (AVG)   |      |  |  |  |
| 500 mV/m / (114 dBμV/m) @ 3 m (Peak)  |      |  |  |  |

### Results:

| Field strength @ 3 meter | Frequency      |                |                 |  |
|--------------------------|----------------|----------------|-----------------|--|
|                          | Lowest channel | Middle channel | Highest channel |  |
| Peak                     | 90.3           | 92.5           | 93.2            |  |
| AVG                      | 89.8           | 92.0           | 92.8            |  |

# 12.2 Occupied bandwidth - 99% emission bandwidth

# **Description:**

Measurement of the 99% bandwidth of the modulated signal acc. RSS-GEN.

| Measurement parameter   |                      |  |  |  |
|-------------------------|----------------------|--|--|--|
| Detector                | Peak                 |  |  |  |
| Sweep time              | Auto                 |  |  |  |
| Resolution bandwidth    | 30 kHz               |  |  |  |
| Video bandwidth         | 100 kHz              |  |  |  |
| Span                    | 3 MHz                |  |  |  |
| Trace mode              | Max Hold             |  |  |  |
| Test setup              | See sub clause 8.4 A |  |  |  |
| Measurement uncertainty | See sub clause 9     |  |  |  |

### Usage:

| -/-   | ISED |  |  |
|---|------|--|--|
| Occupied bandwidth – 99% emission bandwidth |      |  |  |
| OBW is necessary for emission designator    |      |  |  |

# Results:

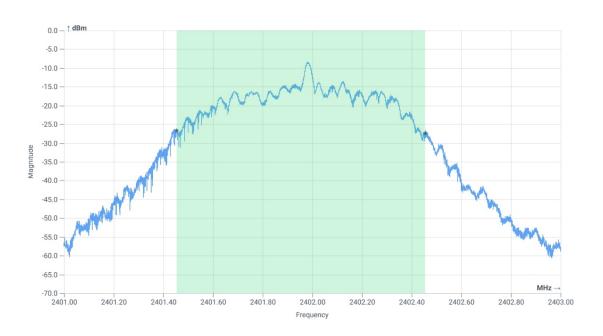

|                     | Frequency      |                |                 |
|---------------------|----------------|----------------|-----------------|
|                     | Lowest channel | Middle channel | Highest channel |
| 99% bandwidth (kHz) | 999            | 947            | 941             |

# 12.3 Band edge compliance radiated

# **Description:**

Measurement of the radiated band edge compliance.

| Measurement parameters  |                      |  |  |
|-------------------------|----------------------|--|--|
| Detector                | Peak / RMS           |  |  |
| Sweep time              | Auto                 |  |  |
| Resolution bandwidth    | 1 MHz                |  |  |
| Video bandwidth         | 3 MHz                |  |  |
| Trace mode              | Max hold             |  |  |
| Test setup              | See sub clause 8.2 B |  |  |
| Measurement uncertainty | See sub clause 9     |  |  |

## Limits:

| FCC   | ISED                |  |  |
|---|---------------------|--|--|
| Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209 / RSS GEN, whichever is the lesser attenuation. |                     |  |  |
|   | //m AVG<br>//m Peak |  |  |

# Result:

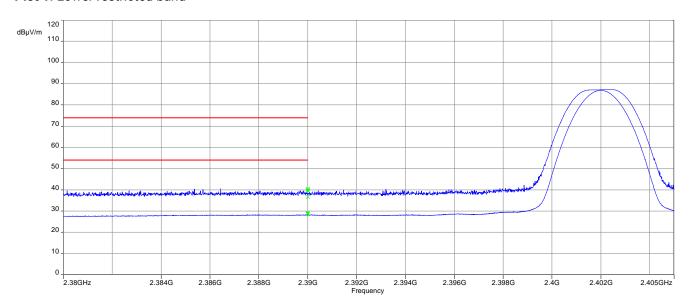

| Scenario              | Band edge compliance radiated [dBμV/m] |
|-----------------------|--|
| Lower restricted band | 29.1 dBμV/m AVG<br>39.9 dBμV/m Peak    |
| Upper restricted band | 34.1 dBμV/m AVG<br>45.6 dBμV/m Peak    |
