### History of this test report

Version	Description	Issue Date
01	Initial issue of report	Nov. 06, 2023

## **1. Introduction Section**

FCC ID: PKRISGM3000A (parent model) and FCC ID: PKRISGM3000D (variant model) use the same identical internal printed circuit board layouts, while the variant model depopulates some while the variant model depopulates some 5G-FR2 band related components, details are available in the operational description. Based on their similarity, the FCC FCC Part 27 (equipment class: PCB) and FCC Part 96 (equipment class: CBE) reuse the original model's result and do spot-check. The spot check data in this report is used to justify the data reuse

The applicant should take full responsibility that the test data as referenced in this report represent compliance for this FCC ID: PKRISGM3000D.

## **2. Model Difference Information**

PKRISGM3000A and PKRISGM3000D use the identical internal printed circuit board layout, and the difference in the components population:

- PKRISGM3000D: Does Not support 5G-FR2 (mmW). All components related to mmW operation are depopulated.
- PKRISGM3000D: Supported frequency bands for M3000A and M3000D are configured (disabled/enabled) in the software at the factory during production.

The detail of similarity and difference is illustrated in the operational description, and based on the information spot check on conducted power and emission was performed for ensure compliance

### 3. Spot Check Verification Data Section

Conducted power test and radiated spurious emission test configurations were selected from the worst cases identified in the parent model and tested to demonstrate the test data from original model remains representative for the variant model.

Summary for power and RSE spot check for each rule entry and technology is listed as below:

**Conclusion:**

Radiated spurious emission test against the variant model based on the worst-case condition from the original model was performed in this filing to demonstrate the test data from original model remains representative for the variant model.

The spot check emission level is not degraded more than 3dB, and the margin to the limit is greater than 1.5dB, data referencing is justified according to the guidance in the KDB inquiry
