# CERTIFICATE OF COMPLIANCE SAR EVALUATION

Inseego Dates of Test: May 24 & June 12, 2022 9645 Scranton Road, Suite 205 Test Report Number: SAR.20220613 San Diego, CA 92121 Revision C

FCC ID: PKRISGM3100

HVIN/Model(s): M3100 Product Market Number (PMN): M3100

Test Sample: Engineering Unit Same as Production

Serial Number: BB110122F00067, BB110122F00083, BB110122F00134

Equipment Type: Portable Router (Hotspot)
Classification: Portable Transmitter Next to Body

TX Frequency Range: 699 – 716 MHz, 777 – 787 MHz, 788 – 798 MHz, 814 – 849 MHz, 1710 – 1780 MHz,

1850 – 1915 MHz, 2500 – 2570 MHz, 3550 – 3700 MHz, 2412 – 2462 MHz, 5150 – 5250 MHz,

5745 - 5825 MHz

Frequency Tolerance: ± 2.5 ppm

Maximum RF Output: 750 MHz (LTE) – 24.0 dBm, 850 MHz (WCDMA) – 24.0 dBm, 850 MHz (LTE) – 24.0 dBm,

1750 MHz (WCDMA) - 24.0 dBm, 1750 MHz (LTE) - 24.5 dBm, 1900 MHz (WCDMA) - 24.0 dBm,

1900 MHz (LTE) – 24.5 dBm, 2550 MHz (LTE) – 24.0 dBm, 3600 MHz (LTE) – 21.5 dBm,

2450 MHz (b) – 18.0 dB, 2450 MHz (g) – 18.0 dB, 2450 MHz (ax/n20) – 18.0 dB, 5250 MHz (a) – 12.0 dB, 5250 MHz (ax/n20) – 12.0 dB, 5250 MHz (ac20) – 12.0 dB,

5800 MHz (a) - 16.0 dB, 5800 MHz (ax/n20) - 16.0 dB, 5800 MHz (ac20) - 16.0 dB Conducted

Signal Modulation: WCDMA, QPSK, 16QAM, DSSS, OFDM

Antenna Type: Internal Application Type: Certification

FCC Rule Parts: Part 2, 15C, 22, 24, 27, 90

KDB Test Methodology: KDB 447498 D01 v07, KDB 248227 v02r02, KDB 941225 D01 v03r01, D02 v02r01, D05 v02r05 &

D06 v02r01

Industry Canada: RSS-102 Issue 5, Safety Code 6

Max. Stand Alone SAR Value: 0.88 W/kg Reported Max. Simultaneous SAR Value: 1.36 W/kg Reported

Max. Simultaneous Value: 0.79 Ratio Separation Distance: 10 mm

This wireless mobile and/or portable device has been shown to be compliant for localized specific absorption rate (SAR) for uncontrolled environment/general exposure limits specified in ANSI/IEEE Std. C95.1-1992 and had been tested in accordance with the measurement procedures specified in IEEE 1528-2013 and IEC 62209-1528:2020 (See test report).

I attest to the accuracy of the data. All measurements were performed by myself or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

RF Exposure Lab, LLC certifies that no party to this application is subject to a denial of Federal benefits that includes FCC benefits pursuant to Section 5301 of the Anti-Drug Abuse Act of 1988, 21 U.S.C. 853(a).

Jay M. Moulton Vice President

Note: The latest version supersedes all previous versions listed in the above table. The latest version shall be used.

### 1. Introduction

This measurement report shows compliance of the Inseego Model M3100 FCC ID: PKRISGM3000A with FCC Part 2, 1093, ET Docket 93-62 Rules for mobile and portable devices. The FCC has adopted the guidelines for evaluating the environmental effects of radio frequency radiation in ET Docket 93-62 on August 6, 1996 to protect the public and workers from the potential hazards of RF emissions due to FCC regulated portable devices. [1], [6]

The testing of this device utilized data re-use per KDB 484596. The original unit was filed under Model M3000A FCC ID: PKRISGM3000A. The data is being referenced in the SAR report filed number SAR.20220610. All data in this report was taken on the M3100 referencing the original model's data.

The test results recorded herein are based on a single type test of Inseego Model M3100 and therefore apply only to the tested sample.

The test procedures and limits, as described in ANSI C95.1 – 1999 Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz [2], ANSI C95.3 – 2002 Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields [3], IEEE Std.1528 – 2013 Recommended Practice [4], and Industry Canada Safety Code 6 Limits of Human Exposure to Radiofrequency Electromagnetic Fields in the Frequency Range from 3kHz to 300 GHz were employed.

The following table indicates all the wireless technologies operating in the M3100 Portable Router (Hotspot). The table also shows the tolerance for the power level for each mode.

| Band                   | Technology | Power   | 3GPP<br>Nominal<br>Power<br>dBm | Calibrated<br>Nominal<br>Power<br>dBm | Tolerance<br>dBm | Lower<br>Tolerance<br>dBm | Upper<br>Tolerance<br>dBm |
|------------------------|------------|---------|---------------------------------|---------------------------------------|------------------|---------------------------|---------------------------|
| Band 12 & 17 – 750 MHz | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 13 - 750 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 5 – 835 MHz       | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 4 & 66 – 1750 MHz | LTE        | Full    | 23.0                            | 23.0                                  | +1.5/-1.3        | 21.7                      | 24.5                      |
| Band 4 & 66 – 1750 MHz | LTE        | Backoff | 18.5                            | 18.5                                  | +1.0/-1.3        | 17.2                      | 19.5                      |
| Band 2 – 1900 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.5/-1.3        | 21.7                      | 24.5                      |
| Band 2 – 1900 MHz      | LTE        | Backoff | 16.0                            | 16.0                                  | +1.5/-1.3        | 14.7                      | 17.5                      |
| Band 7 – 2550 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 7 – 2550 MHz      | LTE        | Backoff | 18.5                            | 18.5                                  | +1.0/-1.3        | 17.2                      | 19.5                      |

# **SAR Definition [5]**

Specific Absorption Rate is defined as the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dV) of a given density ( $\rho$ ).

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dV} \right)$$

SAR is expressed in units of watts per kilogram (W/kg). SAR can be related to the electric field at a point by

$$SAR = \frac{\sigma \mid E \mid^2}{\rho}$$

where:

 $\sigma$  = conductivity of the tissue (S/m)

 $\rho$  = mass density of the tissue (kg/m<sup>3</sup>)

E = rms electric field strength (V/m)

# 2. SAR Measurement Setup

# **Robotic System**

These measurements are performed using the DASY52 automated dosimetric assessment system. The DASY52 is made by Schmid & Partner Engineering AG (SPEAG) in Zurich, Switzerland and consists of high precision robotics system (Staubli), robot controller, Intel Core2 computer, near-field probe, probe alignment sensor, and the generic twin phantom containing the brain equivalent material. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF) (see Fig. 2.1).

### **System Hardware**

A cell controller system contains the power supply, robot controller teach pendant (Joystick), and a remote control used to drive the robot motors. The PC consists of the HP Intel Core2 computer with Windows XP system and SAR Measurement Software DASY52, A/D interface card, monitor, mouse, and keyboard. The Staubli Robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit that performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical into digital electric signal of the DAE and transfers data to the PC plug-in card.

Figure 2.1 SAR Measurement System Setup

# **System Electronics**

RF Exposure Lab

The DAE4 consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the PC-card is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe mounting device includes two different sensor systems for frontal and sidewise probe contacts. They are also used for mechanical surface detection and probe collision detection. The robot uses its own controller with a built in VME-bus computer. The system is described in detail in.

## **Probe Measurement System**

The SAR measurements were conducted with the dosimetric probe EX3DV4, designed in the classical triangular configuration (see Fig. and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multi line ending at the front of the probe tip. (see Fig. 2.3) It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. distance of the coupling maximum to the surface is independent of surface reflectivity and largely independent of the surface to probe The DASY52 software reads the reflection during a angle. software approach and looks for the maximum using a 2nd order fitting. The approach is stopped at reaching the maximum.

the

## **Probe Specifications**

Calibration: In air from 10 MHz to 6.0 GHz

In brain and muscle simulating tissue at Frequencies of 450 MHz, 835 MHz, 1750 MHz, 1900 MHz, 2450 MHz, 2600 MHz, 3500 MHz, 5200 MHz, 5300 MHz, 5600 MHz, 5800

MHz

Frequency: 10 MHz to 6 GHz

Linearity: ±0.2dB (30 MHz to 6 GHz)

Dynamic: 10 mW/kg to 100 W/kg

Range: Linearity: ±0.2dB

**Dimensions:** Overall length: 330 mm

Tip length: 20 mm

Body diameter: 12 mm

Tip diameter: 2.5 mm

Distance from probe tip to sensor center: 1 mm

**Application:** SAR Dosimetry Testing

Compliance tests of wireless device

Report Number: SAR.20220613

Figure 2.2 Triangular Probe Configurations

Figure 2.3 Probe Thick-Film Technique

#### **Probe Calibration Process**

#### Report Number: SAR.20220613

#### **Dosimetric Assessment Procedure**

Each probe is calibrated according to a dosimetric assessment procedure described in with accuracy better than +/-10%. The spherical isotropy was evaluated with the procedure described in and found to be better than +/-0.25dB. The sensitivity parameters (Norm X, Norm Y, Norm Z), the diode compression parameter (DCP) and the conversion factor (Conv F) of the probe is tested.

#### Free Space Assessment

The free space E-field from amplified probe outputs is determined in a test chamber. This is performed in a TEM cell for frequencies below 1 GHz, and in a waveguide above 1GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity at the proper orientation with the field. The probe is then rotated 360 degrees until the three channels show the maximum reading. The power density readings equates to 1 mW/cm<sup>2</sup>.

#### Temperature Assessment \*

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The measured free space E-field in the medium, correlates to temperature rise in a dielectric medium. For temperature correlation calibration a RF transparent thermistor based temperature probe is used in conjunction with the E-field probe

$$SAR = C \frac{\Delta T}{\Delta t}$$

$$SAR = \frac{\left|E\right|^2 \cdot \sigma}{\rho}$$

where: where:

 $\Delta t$  = exposure time (30 seconds),

 $\sigma$  = simulated tissue conductivity,

C = heat capacity of tissue (brain or muscle),

 $\rho = \text{Tissue} \text{ density } (1.25 \text{ g/cm}^3 \text{ for brain tissue})$ 

 $\Delta T$  = temperature increase due to RF exposure.

SAR is proportional to  $\Delta T$  /  $\Delta t$  , the initial rate of tissue heating, before thermal diffusion takes place.

Now it's possible to quantify the electric field in the simulated tissue by

equating the thermally derived SAR to the E- field;

Figure 2.4 E-Field and Temperature Measurements at 900MHz

Figure 2.5 E-Field and Temperature Measurements at 1800MHz

#### **Data Extrapolation**

Report Number: SAR.20220613

The DASY52 software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given like below;

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$$

with  $V_i$  = compensated signal of channel i (i=x,y,z)  $U_i$  = input signal of channel i (i=x,y,z)

cf = crest factor of exciting field (DASY parameter) dcp<sub>i</sub> = diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

E-field probes:

$$E_{i} = \sqrt{\frac{V_{i}}{Norm_{i} \cdot ConvF}}$$

 $V_i$  = compensated signal of channel i (i = x,y,z)

Norm, = sensor sensitivity of channel i (i = x,y,z)

μV/(V/m)2 for E-field probes

ConvF = sensitivity of enhancement in solution E<sub>i</sub> = electric field strength of channel i in V/m

= electric field strength of channel i in v/n

The RSS value of the field components gives the total field strength (Hermetian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1000}$$

with SAR = local specific absorption rate in W/g

E<sub>tot</sub> = total field strength in V/m

σ = conductivity in [mho/m] or [Siemens/m]

ρ = equivalent tissue density in g/cm³

The power flow density is calculated assuming the excitation field to be a free space field.

$$P_{pue} = \frac{E_{tot}^2}{3770}$$

E<sub>re</sub> = total electric field strength in V/m

#### Scanning procedure

- Report Number: SAR.20220613
- The DASY installation includes predefined files with recommended procedures for measurements and system check. They are read-only document files and destined as fully defined but unmeasured masks. All test positions (head or body-worn) are tested with the same configuration of test steps differing only in the grid definition for the different test positions.
- The "reference" and "drift" measurements are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure. The indicated drift is mainly the variation of the DUT's output power and should vary max. +/- 5 %.
- The highest integrated SAR value is the main concern in compliance test applications. These values can mostly be found at the inner surface of the phantom and cannot be measured directly due to the sensor offset in the probe. To extrapolate the surface values, the measurement distances to the surface must be known accurately. A distance error of 0.5mm could produce SAR errors of 6% at 1800 MHz. Using predefined locations for measurements is not accurate enough. Any shift of the phantom (e.g., slight deformations after filling it with liquid) would produce high uncertainties. For an automatic and accurate detection of the phantom surface, the DASY5 system uses the mechanical surface detection. The detection is always at touch, but the probe will move backward from the surface the indicated distance before starting the measurement.
- The "area scan" measures the SAR above the DUT or verification dipole on a parallel plane to the surface. It is used to locate the approximate location of the peak SAR with 2D spline interpolation. The robot performs a stepped movement along one grid axis while the local electrical field strength is measured by the probe. The probe is touching the surface of the SAM during acquisition of measurement values. The scan uses different grid spacings for different frequency measurements. Standard grid spacing for head measurements in frequency ranges ≥ 2GHz is 15 mm in x and y- dimension. For higher frequencies a finer resolution is needed, thus for the grid spacing is reduced according the following table:

| Area scan grid spacing for different frequency ranges |              |  |  |  |  |
|---|--------------|--|--|--|--|
| Frequency range                                       | Grid spacing |  |  |  |  |
| ≤ 2 GHz   | ≤ 15 mm      |  |  |  |  |
| 2 – 4 GHz   | ≤ 12 mm      |  |  |  |  |
| 4 – 6 GHz   | ≤ 10 mm      |  |  |  |  |

Grid spacing and orientation have no influence on the SAR result. For special applications where the standard scan method does not find the peak SAR within the grid, e.g. mobile phones with flip cover, the grid can be adapted in orientation. Results of this coarse scan are shown in annex B.

A "zoom scan" measures the field in a volume around the 2D peak SAR value acquired in the
previous "coarse" scan. It uses a fine meshed grid where the robot moves the probe in steps along all the
3 axis (x,y and z-axis) starting at the bottom of the Phantom. The grid spacing for the cube measurement
is varied according to the measured frequency range, the dimensions are given in the following table:

| Zoom scan grid spacing and volume for different frequency ranges |               |              |              |  |  |  |
|--|---------------|--------------|--------------|--|--|--|
| Frequency range  | Grid spacing  | Grid spacing | Minimum zoom |  |  |  |
| rrequency range  | for x, y axis | for z axis   | scan volume  |  |  |  |
| ≤ 2 GHz  | ≤ 8 mm        | ≤ 5 mm       | ≥ 30 mm      |  |  |  |
| 2 – 3 GHz  | ≤ 5 mm        | ≤ 5 mm       | ≥ 28 mm      |  |  |  |
| 3 – 4 GHz  | ≤ 5 mm        | ≤ 4 mm       | ≥ 28 mm      |  |  |  |
| 4 – 5 GHz  | ≤ 4 mm        | ≤ 3 mm       | ≥ 25 mm      |  |  |  |
| 5 – 6 GHz  | ≤ 4 mm        | ≤ 2 mm       | ≥ 22 mm      |  |  |  |

DASY is also able to perform repeated zoom scans if more than 1 peak is found during area scan. In this document, the evaluated peak 1g and 10g averaged SAR values are shown in the 2D-graphics in annex B. Test results relevant for the specified standard (see section 3) are shown in table form in section 7.

#### **Spatial Peak SAR Evaluation**

The spatial peak SAR - value for 1 and 10 g is evaluated after the Cube measurements have been done. The basis of the evaluation are the SAR values measured at the points of the fine cube grid consisting of all points in the three directions x, y and z. The algorithm that finds the maximal averaged volume is separated into three different stages.

- The data between the dipole center of the probe and the surface of the phantom are extrapolated. This data cannot be measured since the center of the dipole is 1 to 2.7 mm away from the tip of the probe and the distance between the surface and the lowest measuring point is about 1 mm (see probe calibration sheet). The extrapolated data from a cube measurement can be visualized by selecting 'Graph Evaluated'.
- The maximum interpolated value is searched with a straight-forward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1g or 10 g) are computed using the 3d-spline interpolation algorithm. If the volume cannot be evaluated (i.e., if a part of the grid was cut off by the boundary of the measurement area) the evaluation will be started on the corners of the bottom plane of the cube.
- All neighbouring volumes are evaluated until no neighbouring volume with a higher average value is found.

#### Extrapolation

The extrapolation is based on a least square algorithm [W. Gander, Computermathematik, p.168-180]. Through the points in the first 3 cm along the z-axis, polynomials of order four are calculated. These polynomials are then used to evaluate the points between the surface and the probe tip. The points, calculated from the surface, have a distance of 1 mm from each other.

#### Interpolation

The interpolation of the points is done with a 3d-Spline. The 3d-Spline is composed of three one-dimensional splines with the "Not a knot"-condition [W. Gander, Computermathematik, p.141-150] (x, y and z -direction) [Numerical Recipes in C, Second Edition, p.123ff].

#### **Volume Averaging**

At First the size of the cube is calculated. Then the volume is integrated with the trapezoidal algorithm. 8000 points (20x20x20) are interpolated to calculate the average.

#### **Advanced Extrapolation**

DASY uses the advanced extrapolation option which is able to compensate boundary effects on E-field probes.

#### **SAM PHANTOM**

Report Number: SAR.20220613

The SAM Twin Phantom V4.0 is constructed of a fiberglass shell integrated in a wooden table. The shape of the shell is based on data from an anatomical study designed to determine the maximum exposure in at least 90% of all users. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents the evaporation of the liquid. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. (see Fig. 2.6)

## **Phantom Specification**

Phantom: SAM Twin Phantom (V4.0)
Shell Material: Vivac Composite
2.0 ± 0.2 mm

Figure 2.6 SAM Twin Phantom

#### **Device Holder for Transmitters**

In combination with the SAM Twin Phantom V4.0 the Mounting Device (see Fig. 2.7), enables the rotation of the mounted transmitter in spherical coordinates whereby the rotation point is the ear opening. The devices can be easily, accurately, and repeat ably be positioned according to the FCC, CENELEC, IEC and IEEE specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

**Figure 2.7 Mounting Device** 

Note: A simulating human hand is not used due to the complex anatomical and geometrical structure of the hand that may produce infinite number of configurations. To produce the worst-case condition (the hand absorbs antenna output power), the hand is omitted during the tests.

# 3. Probe and Dipole Calibration

See Appendix D and E.

# 4. Phantom & Simulating Tissue Specifications

## **Head & Body Simulating Mixture Characterization**

The head and body mixtures consist of the material based on the table listed below. The mixture is calibrated to obtain proper dielectric constant (permittivity) and conductivity of the desired tissue. Body tissue parameters that have not been specified in IEEE1528 – 2013 are derived from the issue dielectric parameters computed from the 4-Cole-Cole equations.

**Table 4.1 Typical Composition of Ingredients for Tissue**

# 5. **ANSI/IEEE C95.1 – 1992 RF Exposure Limits [2]**

#### **Uncontrolled Environment**

Uncontrolled Environments are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure. The general population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity.

#### **Controlled Environment**

Controlled Environments are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation). In general, occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure. This exposure category is also applicable when the exposure is of a transient nature due to incidental passage through a location where the exposure levels may be higher than the general population/uncontrolled limits, but the exposed person is fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

**Table 5.1 Human Exposure Limits** 

|   | UNCONTROLLED ENVIRONMENT General Population (W/kg) or (mW/g) | CONTROLLED ENVIROMENT Professional Population (W/kg) or (mW/g) |
|---|--|--|
| SPATIAL PEAK SAR <sup>1</sup><br>Head                     | 1.60   | 8.00   |
| SPATIAL AVERAGE SAR <sup>2</sup><br>Whole Body            | 0.08   | 0.40   |
| SPATIAL PEAK SAR <sup>3</sup> Hands, Feet, Ankles, Wrists | 4.00   | 20.00  |

<sup>&</sup>lt;sup>1</sup> The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

<sup>&</sup>lt;sup>2</sup> The Spatial Average value of the SAR averaged over the whole body.

<sup>&</sup>lt;sup>3</sup> The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

<sup>© 2022</sup> RF Exposure Lab, LLC

# 6. Measurement Uncertainty

Measurement uncertainty table is not required per KDB 865664 D01 v01 section 2.8.2 page 12. SAR measurement uncertainty analysis is required in the SAR report only when the highest measured SAR in a frequency band is  $\geq$  1.5 W/kg for 1-g SAR. The equivalent ratio (1.5/1.6) should be applied to extremity and occupational exposure conditions. The highest reported value is less than 1.5 W/kg. Therefore, the measurement uncertainty table is not required.

# 7. System Validation

## **Tissue Verification**

**Table 7.1 Measured Tissue Parameters**

# 8. LTE Document Checklist

1) Identify the operating frequency range of each LTE transmission band used by the device

| LTE Operating | Uplink (transmit) | Downlink (Receive) | Duplex mode |
|---------------|-------------------|--------------------|-------------|
| Band          | Low - high        | Low - high         | (FDD/TDD)   |
| 2             | 1850-1910         | 1930-1990          | FDD         |
| 4             | 1710-1755         | 2110-2155          | FDD         |
| 5             | 824-849           | 869-894            | FDD         |
| 7             | 2500-2570         | 2620-2690          | FDD         |
| 12            | 699-716           | 729-746            | FDD         |
| 13            | 777-787           | 746-756            | FDD         |
| 17            | 704-716           | 734-746            | FDD         |
| 48            | 3550-3700         | 3550-3700          | TDD         |
| 66            | 1710-1780         | 2110-2200          | FDD         |

2) Identify the channel bandwidths used in each frequency band; 1.4, 3, 5, 10, 15, 20 MHz etc

| LTE Band Class | Bandwidth (MHz)       | Frequency or Freq. Band (MHz) |
|----------------|-----------------------|-------------------------------|
| 2              | 1.4, 3, 5, 10, 15, 20 | 1850-1910 MHz                 |
| 4              | 1.4, 3, 5, 10, 15, 20 | 1710-1755 MHz                 |
| 5              | 1.4, 3, 5, 10         | 824-849 MHz                   |
| 7              | 5, 10, 15, 20         | 2500-2570 MHz                 |
| 12             | 1.4, 3, 5, 10         | 699-716 MHz                   |
| 13             | 5, 10                 | 777-787 MHz                   |
| 17             | 5, 10                 | 704-716 MHz                   |
| 48             | 5, 10, 15, 20         | 3550-3700 MHz                 |
| 66             | 1.4, 3, 5, 10, 15, 20 | 1710-1780 MHz                 |

3) Identify the high, middle and low (H, M, L) channel numbers and frequencies in each LTE frequency band

| LTE Band | Bandwidth | Frequency (MHz)/Channel # |        |        |        |        |        |
|----------|-----------|---------------------------|--------|--------|--------|--------|--------|
| Class    | (MHz)     | L                         | ow     | N.     | Mid    |        | gh     |
| 2        | 1.4       | 1850.7                    | 18607  | 1880.0 | 18900  | 1909.3 | 19193  |
| 2        | 3         | 1851.5                    | 18615  | 1880.0 | 18900  | 1908.5 | 19185  |
| 2        | 5         | 1852.5                    | 18625  | 1880.0 | 18900  | 1907.5 | 19175  |
| 2        | 10        | 1855.0                    | 18650  | 1880.0 | 18900  | 1905.0 | 19150  |
| 2        | 15        | 1857.5                    | 18675  | 1880.0 | 18900  | 1902.5 | 19125  |
| 2        | 20        | 1860.0                    | 18700  | 1880.0 | 18900  | 1900.0 | 19100  |
| 4        | 1.4       | 1710.7                    | 19957  | 1732.5 | 20175  | 1754.3 | 20393  |
| 4        | 3         | 1711.5                    | 19965  | 1732.5 | 20175  | 1753.5 | 20385  |
| 4        | 5         | 1712.5                    | 19975  | 1732.5 | 20175  | 1752.5 | 20375  |
| 4        | 10        | 1715.0                    | 20000  | 1732.5 | 20175  | 1750.0 | 20350  |
| 4        | 15        | 1717.5                    | 20025  | 1732.5 | 20175  | 1747.5 | 20325  |
| 4        | 20        | 1720.0                    | 20050  | 1732.5 | 20175  | 1745.0 | 20300  |
| 5        | 1.4       | 824.7                     | 20407  | 836.5  | 20525  | 848.3  | 20643  |
| 5        | 3         | 825.5                     | 20415  | 836.5  | 20525  | 847.5  | 20635  |
| 5        | 5         | 826.5                     | 20425  | 836.5  | 20525  | 846.5  | 20625  |
| 5        | 10        | 829.0                     | 20450  | 836.5  | 20525  | 844.0  | 20600  |
| 7        | 5         | 2502.5                    | 20775  | 2535.0 | 21100  | 2567.5 | 21425  |
| 7        | 10        | 2505.0                    | 20800  | 2535.0 | 21100  | 2565.0 | 21400  |
| 7        | 15        | 2507.5                    | 20825  | 2535.0 | 21100  | 2562.5 | 21375  |
| 7        | 20        | 2510.0                    | 20850  | 2535.0 | 21100  | 2560.0 | 21350  |
| 12       | 1.4       | 699.7                     | 23017  | 707.5  | 23095  | 715.3  | 23173  |
| 12       | 3         | 700.5                     | 23025  | 707.5  | 23095  | 714.5  | 23165  |
| 12       | 5         | 701.5                     | 23035  | 707.5  | 23095  | 713.5  | 23155  |
| 12       | 10        | 704.0                     | 23060  | 707.5  | 23095  | 711.0  | 23130  |
| 13       | 5         | 779.5                     | 23205  | 782.0  | 23230  | 784.5  | 23225  |
| 13       | 10        |                           |        | 782.0  | 23230  |        |        |
| 17       | 5         | 706.5                     | 23755  | 710.0  | 23790  | 713.5  | 23825  |
| 17       | 10        | 709.0                     | 23780  | 710.0  | 23790  | 711.0  | 23790  |
| 48       | 5         | 3552.5                    | 55265  | 3526.0 | 55990  | 3697.5 | 56715  |
| 48       | 10        | 3555.0                    | 55290  | 3526.0 | 55990  | 3695.0 | 56690  |
| 48       | 15        | 3557.5                    | 55315  | 3526.0 | 55990  | 3692.5 | 56665  |
| 48       | 20        | 3560.0                    | 55340  | 3526.0 | 55990  | 3690.0 | 56640  |
| 66       | 1.4       | 1710.7                    | 131979 | 1755.0 | 132422 | 1779.3 | 132665 |
| 66       | 3         | 1711.5                    | 131987 | 1755.0 | 132422 | 1778.5 | 132657 |
| 66       | 5         | 1712.5                    | 131997 | 1755.0 | 132422 | 1777.4 | 132646 |
| 66       | 10        | 1716.1                    | 132033 | 1755.0 | 132422 | 1774.9 | 132621 |
| 66       | 15        | 1717.5                    | 132047 | 1755.0 | 132422 | 1772.4 | 132596 |
| 66       | 20        | 1720.0                    | 132072 | 1755.0 | 132422 | 1769.9 | 132571 |

Report Number: SAR.20220613
4) Specify the UE category and uplink modulations used:

- Specify the OL category and uplink i
  - UE Category: 3
  - Uplink modulations: QPSK and 16QAM
- 5) Include descriptions of the LTE transmitter and antenna implementation; and also identify whether it is a standalone transmitter operating independently of other wireless transmitters in the device or sharing hardware components and/or antenna(s) with other transmitters etc

The device has 13 antennas:

- 5 3G, 4G, FR1 (Transmit and Receive) Antennas
- 4 3G, 4G, FR1 (Receive Only) Antennas
- 2 WiFi (Transmit and Receive) Antennas
- 2 FR2 (Transmit and Receive) Antennas
- 6) Identify the LTE voice/data requirements in each operating mode and exposure condition with respect to head and body test configurations, antenna locations, handset flip-cover or slide positions, antenna diversity conditions etc

The device is a data only. Data mode was tested in each operating mode and exposure condition in the body configuration. See test setup photos to see all configurations tested.

- 7) Identify if Maximum Power Reduction (MPR) is optional or mandatory, i.e. built-in by design:
  - a) Only mandatory MPR may be considered during SAR testing, when the maximum output power is permanently limited by the MPR implemented within the UE; and only for the applicable RB (resource block) configurations specified in LTE standards

MPR is mandatory, built-in by design on all production units. It was enabled during testing.

| Modulation | Ch  | Channel Bandwidth/transmission Bandwidth Configuration |     |      |      |      |     |  |  |
|------------|-----|--|-----|------|------|------|-----|--|--|
|            |     | (RB)   |     |      |      |      |     |  |  |
|            | 1.4 | 1.4 3.0 5 10 15 20                                     |     |      |      |      |     |  |  |
|            | MHz | MHZ  | MHz | MHz  | MHz  | MHz  |     |  |  |
| QPSK       | > 5 | > 4  | > 8 | > 12 | > 16 | > 18 | ≤ 1 |  |  |
| 16QAM      | ≤ 5 | ≤ <b>4</b>   | ≤ 8 | ≤ 12 | ≤ 16 | ≤ 18 | ≤ 1 |  |  |
| 16QAM      | > 5 | > 4  | > 8 | > 12 | > 16 | > 18 | ≤ 2 |  |  |

- b) A-MPR (additional MPR) must be disabled
- c) A-MPR was disabled during testing.

8) Include the maximum average conducted output power measured on the required test channels for each channel bandwidth and UL modulation used in each frequency band:

The maximum average conducted output power measured for the testing is listed on pages 35-86 of this report. The below table shows the factory set point with the allowable tolerance.

| Band                   | Technology | Power   | 3GPP<br>Nominal<br>Power<br>dBm | Calibrated<br>Nominal<br>Power<br>dBm | Tolerance<br>dBm | Lower<br>Tolerance<br>dBm | Upper<br>Tolerance<br>dBm |
|------------------------|------------|---------|---------------------------------|---------------------------------------|------------------|---------------------------|---------------------------|
| Band 12 & 17 – 750 MHz | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 13 - 750 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 5 – 835 MHz       | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 4 & 66 - 1750 MHz | LTE        | Full    | 23.0                            | 23.0                                  | +1.5/-1.3        | 21.7                      | 24.5                      |
| Band 4 & 66 - 1750 MHz | LTE        | Backoff | 18.5                            | 18.5                                  | +1.0/-1.3        | 17.2                      | 19.5                      |
| Band 2 – 1900 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.5/-1.3        | 21.7                      | 24.5                      |
| Band 2 – 1900 MHz      | LTE        | Backoff | 16.0                            | 16.0                                  | +1.5/-1.3        | 14.7                      | 17.5                      |
| Band 7 – 2550 MHz      | LTE        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 21.7                      | 24.0                      |
| Band 7 – 2550 MHz      | LTE        | Backoff | 18.5                            | 18.5                                  | +1.0/-1.3        | 17.2                      | 19.5                      |
| Band 48 – 3600 MHz     | LTE        | Full    | 20.5                            | 20.5                                  | +1.0/-1.3        | 19.2                      | 21.5                      |

9) Identify all other U.S. wireless operating modes (3G, Wi-Fi, WiMax, Bluetooth etc), device/exposure configurations (head and body, antenna and handset flip-cover or slide positions, antenna diversity conditions etc.) and frequency bands used for these modes

Other wireless modes:

| Band                       | Technology        | Power   | 3GPP<br>Nominal<br>Power<br>dBm | Calibrated<br>Nominal<br>Power<br>dBm | Tolerance<br>dBm | Lower<br>Tolerance<br>dBm | Upper<br>Tolerance<br>dBm |
|----------------------------|-------------------|---------|---------------------------------|---------------------------------------|------------------|---------------------------|---------------------------|
| Band 5 – 850 MHz           | WCDMA/HSPA        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 22.0                      | 24.0                      |
| Band 4 – 1750 MHz          | WCDMA/HSPA        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 22.0                      | 24.0                      |
| Band 4 – 1750 MHz          | WCDMA/HSPA        | Backoff | 16.0                            | 16.0                                  | +1.0/-1.3        | 15.0                      | 17.0                      |
| Band 2 – 1900 MHz          | WCDMA/HSPA        | Full    | 23.0                            | 23.0                                  | +1.0/-1.3        | 22.0                      | 24.0                      |
| Band 2 – 1900 MHz          | WCDMA/HSPA        | Backoff | 15.0                            | 15.0                                  | +1.0/-1.3        | 14.0                      | 16.0                      |

10) Include the maximum average conducted output power measured for the other wireless modes and frequency bands.

The maximum average conducted output power measured for the testing is listed on pages 33 and 87-88 of this report. The table in item 9 shows the factory set point with the allowable tolerance.

11) When power reduction is applied to certain wireless modes to satisfy SAR compliance for simultaneous transmission conditions, other equipment certification or operating requirements, include the maximum average conducted output power measured in each power reduction mode applicable to the simultaneous voice/data transmission configurations for such wireless configurations and frequency bands; and also include details of the power reduction implementation and measurement setup

Power reduction is required to satisfy SAR compliance. The DUT has a capacitive coupling sensor to sense the body being close to the unit. When the sensor is triggered (at 21 mm), the maximum power is backed off based on the power levels listed on page 4 of this report. Only the cellular bands are backed off.

12) Include descriptions of the test equipment, test software, built-in test firmware etc. required to support testing the device when power reduction is applied to one or more transmitters/antennas for simultaneous voice/data transmission

The DUT back off was set in the firmware of the module using the existing AT commands. There was no special test equipment or test software required for the testing.

13) When appropriate, include a SAR test plan proposal with respect to the above

Testing was conduct at 10 mm with the sensor operational for all measurements. The sensor was tested by moving the DUT away from the phantom and slowly moving it closer to see when the sensor would trip. The closest distance the sensor trip was 21 mm. The highest SAR value in each band was then tested at 20 mm with the sensor disabled to insure it would not trip.

14) If applicable, include preliminary SAR test data and/or supporting information in laboratory testing inquiries to address specific issues and concerns or for requesting further test reduction considerations appropriate for the device; for example, simultaneous transmission configurations.

Not applicable.

# 9. SAR Test Data Summary See Measurement Result Data Pages

See Appendix B for SAR Test Data Plots. See Appendix C for SAR Test Setup Photos.

## **Procedures Used To Establish Test Signal**

The device was either placed into simulated transmit mode using the manufacturer's test codes or the actual transmission is activated through a base station simulator or similar equipment. See data pages for actual procedure used in measurement.

#### **Device Test Condition**

In order to verify that the device was tested at full power, conducted output power measurements were performed before and after each SAR measurement to confirm the output power unless otherwise noted. If a conducted power deviation of more than 5% occurred, the test was repeated. The power drift of each test is measured at the start of the test and again at the end of the test. The drift percentage is calculated by the formula ((end/start)-1)\*100 and rounded to three decimal places. The drift percentage is calculated into the resultant SAR value on the data sheet for each test.

| Required Test Positions |        |        |        |        |        |        |  |  |  |
|-------------------------|--------|--------|--------|--------|--------|--------|--|--|--|
| Antenna                 | Side A | Side B | Side C | Side D | Side E | Side F |  |  |  |
| Ant 0                   | Yes    | Yes    | Yes    | Yes    | No     | Yes    |  |  |  |
| Ant 1                   | Yes    | Yes    | Yes    | Yes    | Yes    | No     |  |  |  |
| Ant 4                   | Yes    | Yes    | Yes    | No     | No     | Yes    |  |  |  |
| Ant 8                   | Yes    | No     | Yes    | Yes    | No     | No     |  |  |  |
| WiFi 0                  | Yes    | No     | Yes    | Yes    | Yes    | No     |  |  |  |
| WiFi 1                  | Yes    | Yes    | Yes    | No     | No     | Yes    |  |  |  |

This device uses a power reduction mechanism to reduce output powers in certain use conditions when the device is used close the user's body.

When the device's antenna is within a certain distance of the user, the sensor activates and reduces the maximum allowed output power. However, the sensor is not active when the device is moved beyond the sensor triggering distance and the maximum output power is no longer limited. Therefore, additional evaluation is needed in the vicinity of the triggering distance to ensure SAR is compliant when the device is allowed to operate at a non-reduced output power level. FCC KDB Publication 616217 D04v01r02 Section 6 was used as a guideline for selecting SAR test distances for this device at these additional test positions. Sensor triggering distance summary data is included below.

The sensor is designed to support sufficient detection range and sensitivity to cover regions of the sensors in all applicable directions since the sensor entirely covers the antennas. The device form factor will not allow the device to be sitting at an angle. Therefore, tilt measurements were not conducted on this device.

Per the May 2017 TCBC Workshop Notes, demonstration of proper functioning of the power reduction mechanisms is required to support the corresponding SAR configurations. The verification process was divided into two parts: (1) evaluation of the output power levels for individual or multiple triggering mechanisms and (2) evaluation of the triggering distances for proximity-based sensors.

#### 9.1 Power Verification Procedure

The power verification was performed according to the following procedure.

- A base station simulator was used to establish a conducted RF connection and the output power was monitored. The power measurements were confirmed to be within the expected tolerances for all states before and after a power reduction mechanism was triggered.
- Step 1 was repeated for all relevant modes and frequency bands for the mechanism being investigated.
- Steps 1 and 2 were repeated for all individual power reduction mechanisms and combinations thereof. For the combination cases, one mechanism was switched to a "triggered" state at a time; powers were confirmed to be within the tolerances after each additional mechanism was activated.

#### 9.2 Distance Verification Procedure

The distance verification procedure was performed according to the following procedure.

- A base station simulator was used to establish an RF connection and to monitor the power levels. The device being tested was placed below the relevant section of the phantom with the relevant side or edge of the device facing toward the phantom.
- The device was moved toward and away from the phantom to determine the distance at which the mechanism triggers and the output power is reduced, per KDB Publication 616217 D04v01r02 and FCC Guidance. Each applicable test position was evaluated. The distances were confirmed to be the same or larger (more conservative) than the minimum distances provided by the manufacturer.
- Steps 1 and 2 were repeated for low, mid and high bands, as appropriate.
- Steps 1 through 3 were repeated for all distance-based power reduction mechanisms.

# 9.3 WWAN Antenna Verification Summary

Report Number: SAR.20220613

Table 9.1
Power Measurement Verification for WWAN Antenna

| Mechanism       |                        | Conducted Power (dBm) |                           |  |  |
|-----------------|------------------------|-----------------------|---------------------------|--|--|
| 1 <sup>st</sup> | Mode/Band              | Un-triggered (Max)    | Mechanism #1<br>(Reduced) |  |  |
|                 | UMTS 1750              | 23.91                 | 19.16                     |  |  |

|            | Side F         | High | 24             | 23           | 20                   |

#### **WCDMA Conducted Power**

- 1. The following tests were conducted according to the test requirements outlines in 3GPP TS 34.121 specification.
- 2. The procedures in KDB 941225 D01v03r01 are applied for 3GPP Rel. 6 HSPA to configure the device in the required sub-test mode(s) to determine SAR test exclusion.
- 3. For DC-HSDPA, the device was configured according to the H-Set 12, Fixed Reference Channel (FRC) configuration in Table C.8.1.12 of 3GPP TS 34.121-1, with the primary and the secondary serving HS-DSCH Cell enabled during the power measurement.

A summary of these settings are illustrated below:

# **HSDPA SETUP CONFIGURATION:**

- The EUT was connected to Base Station Agilent E5515C referred to the Setup Configuration.
- The RF path losses were compensated into the measurements. b.
- A call was established between EUT and Base Station with following setting:
  - Set Gain Factors ( $\beta_C$  and  $\beta_d$ ) and parameters were set according to each
  - Specific sub-test in the following table, C10.1.4, quoted from the TS 34.121
  - Set RMC 12.2Kbps + HSDPA mode. Set Cell Power = -86 dBm

  - Set HS-DSCH Configuration Type to FRC (H-set 1, QPSK)
  - Select HSDPA Uplink Parameters vi.
  - vii. Set Delta ACK, Delta NACK and Delta CQI = 8
  - viii. Set Ack-Nack Repetition Factor to 3
  - ix. Set CQI Feedback Cycle (k) to 4 ms
  - Set CQI Repetition Factor to 2 Χ.
  - xi. Power Ctrl Mode = All Up bits
- The transmitted maximum output power was recorded.

Table C.10.1.4: β values for transmitter characteristics tests with HS-DPCCH

| Sub-test           | βc                | βd                | β <sub>d</sub><br>(SF) | β₀/βа                                       | βнs<br>(Note1,<br>Note 2) | CM (dB)<br>(Note 3) | MPR (dB)<br>(Note 3) |
|--------------------|-------------------|-------------------|------------------------|---|---------------------------|---------------------|----------------------|
| 1                  | 2/15              | 15/15             | 64                     | 2/15  | 4/15                      | 0.0                 | 0.0                  |
| 2                  | 12/15<br>(Note 4) | 15/15<br>(Note 4) | 64                     | 12/15<br>(Note 4)                           | 24/15                     | 1.0                 | 0.0                  |
| 3                  | 15/15             | 8/15              | 64                     | 15/8  | 30/15                     | 1.5                 | 0.5                  |
| 4                  | 15/15             | 4/15              | 64                     | 15/4  | 30/15                     | 1.5                 | 0.5                  |
| Note 1:<br>Note 2: |                   |                   |                        | = 30/15 * $\beta_c$ .<br>irement test in cl | ause 5.2C, 5.7            | A, and the Erro     | r Vector             |

Magnitude (EVM) with HS-DPCCH test in clause 5.13.1A, and HSDPA EVM with phase discontinuity in clause 5.13.1AA,  $\triangle$ ACK and  $\triangle$ NACK = 30/15 with  $\beta_{hs}$  = 30/15 \*  $\beta_{e}$ , and  $\triangle$ CQI = 24/15 with  $\beta_{hs} = 24/15 * \beta_c$ .

CM = 1 for  $\beta_c/\beta_d$  =12/15,  $\beta_{hs}/\beta_c$ =24/15. For all other combinations of DPDCH, DPCCH and HS-Note 3: DPCCH the MPR is based on the relative CM difference. This is applicable for only UEs that support HSDPA in release 6 and later releases.

For subtest 2 the β<sub>o</sub>/β<sub>d</sub> ratio of 12/15 for the TFC during the measurement period (TF1, TF0) is achieved by setting the signalled gain factors for the reference TFC (TF1, TF1) to  $\beta_c$  = 11/15 and  $\beta_d$ 

#### **SETUP CONFIGURATION**

## **HSUPA SETUP CONFIGURATION:**

- The EUT was connected to Base Station Agilent E5515C referred to the Setup Configuration.
- b. The RF path losses were compensated into the measurements.
- c. A call was established between EUT and Base Station with following setting \*:
  - Call Configs = 5.2B, 5.9B, 5.10B, and 5.13.2B with QPSK
  - ii. Set the Gain Factors (βc and βd) and parameters (AG Index) were set according to each specific sub-test in the following table, C11.1.3, quoted from the TS 34.121
  - iii. Set Cell Power = -86 dBm
  - iv. Set Channel Type = 12.2k + HSPA
  - v. Set UE Target Power
  - vi. Power Ctrl Mode= Alternating bits
  - vii. Set and observe the E-TFCI
  - viii. Confirm that E-TFCI is equal to the target E-TFCI of 75 for sub-test 1, and other subtest's E-TFCI
- d. The transmitted maximum output power was recorded.

Table C.11.1.3: β values for transmitter characteristics tests with HS-DPCCH and E-DCH

| 5            | 15/15             | 0                    | -                      | 100-11               | 5/15           | 5/15        | 47/15  | 4                       | 1                          | 1.0                 | 0.0                                       | 12                         | 67         |

- Note 1: For sub-test 1 to 4,  $\Delta_{ACK}$ ,  $\Delta_{NACK}$  and  $\Delta_{CQI}$  = 30/15 with  $\beta_{hs}$  = 30/15 \*  $\beta_c$  . For sub-test 5,  $\Delta_{ACK}$ ,  $\Delta_{NACK}$  and  $\Delta_{CQI}$  = 5/15 with  $\beta_{hs}$  = 5/15 \*  $\beta_c$  .
- Note 2: CM = 1 for β<sub>e</sub>/β<sub>d</sub> =12/15, β<sub>he</sub>/β<sub>e</sub>=24/15. For all other combinations of DPDCH, DPCCH, HS- DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference.
- Note 3: For subtest 1 the β<sub>c</sub>/β<sub>d</sub> ratio of 11/15 for the TFC during the measurement period (TF1, TF0) is achieved by setting the signalled gain factors for the reference TFC (TF1, TF1) to β<sub>c</sub> = 10/15 and β<sub>d</sub> = 15/15.
- Note 4: In case of testing by UE using E-DPDCH Physical Layer category 1, Sub-test 3 is omitted according to TS25.306 Table 5.1g.
- Note 5: Bed can not be set directly; it is set by Absolute Grant Value.
- Note 6: For subtests 2, 3 and 4, UE may perform E-DPDCH power scaling at max power which could results in slightly smaller MPR values.

## **SETUP CONFIGURATION**

# **DC-HSDPA 3GPP RELEASE 8 SETUP CONFIGURATION:**

- The EUT was connected to Base Station Agilent E5515C referred to the Setup Configuration below
- The RF path losses were compensated into the measurements.
- A call was established between EUT and Base Station with following setting:
  - Set RMC 12.2Kbps + HSDPA mode. Set Cell Power = -25 dBm
  - ii.
  - iii.

  - Set HS-DSCH Configuration Type to FRC (H-set 12, QPSK) Select HSDPA Uplink Parameters Set Gain Factors ( $\beta_C$  and  $\beta_d$ ) and parameters were set according to each Specific sub-test in the following table,

C10.1.4, quoted from the TS

34.121 a). Subtest 1:

 $\beta_{\rm C}/\beta_{\rm d}=2/15$ b). Subtest 2: βc/βd=12/15 c). Subtest 3: βc/βd=15/8 d). Subtest 4:

- $\beta c/\beta d=15/4$ Set Delta ACK, Delta NACK and Delta CQI = 8
- Set Ack-Nack Repetition Factor to 3
- Set CQI Feedback Cycle (k) to 4 ms viii.
- Set CQI Repetition Factor to 2
- Power Ctrl Mode = All Up bits
- The transmitted maximum output power was recorded.

The following tests were conducted according to the test requirements outlines in 3GPP TS 34.121 specification. A summary of these settings are illustrated below:

#### C.8.1.12 Fixed Reference Channel Definition H-Set 12

#### SETUP CONFIGURATION

### < WCDMA Conducted Power>

#### **GENERAL NOTE:**

- 1. Per KDB 941225 D01v03r01, for SAR testing is measured using a 12.2 kbps RMC with TPC bits configured to all "1's".
- 2. Per KDB 941225 D01v03r01, RMC 12.2kbps setting is used to evaluate SAR. The maximum output power and tune-up tolerance specified for production units in HSDPA / HSUPA / DC-HSDPA is ≤ ¼ dB higher than RMC

12.2Kbps or when the highest reported SAR of the RMC12.2Kbps is scaled by the ratio of specified maximum output power and tune-up tolerance of HSDPA/HSUPA/DC-HSDPA to RMC12.2Kbps and the adjusted SAR is  $\leq$  1.2 W/kg, SAR measurement is not required for HSDPA/HSUPA/DC-HSDPA, and according to the following RF output power, the output power results of the secondary modes (HSUPA, HSDPA, DC-HSDPA) are less than  $\frac{1}{4}$  dB higher than the primary modes; therefore, SAR measurement is not required for HSDPA/HSUPA/DC-HSDPA.

# **LTE Conducted Power**

#### General Note:

- 1. Anritsu MT8820C base station simulator was used to setup the connection with EUT; the frequency band, channel bandwidth, RB allocation configuration, modulation type are set in the base station simulator to configure EUT transmitting at maximum power and at different configurations which are requested to be reported to FCC, for conducted power measurement and SAR testing.
- 2. Per KDB 941225 D05v02r05, when a properly configured base station simulator is used for the SAR and power measurements, spectrum plots for each RB allocation and offset configuration is not required.
- 3. Per KDB 941225 D05v02r05, start with the largest channel bandwidth and measure SAR for QPSK with 1 RB allocation, using the RB offset and required test channel combination with the highest maximum output power for RB offsets at the upper edge, middle and lower edge of each required test channel.
- 4. Per KDB 941225 D05v02r05, 50% RB allocation for QPSK SAR testing follows 1RB QPSK allocation procedure.
- 5. Per KDB 941225 D05v02r05, For QPSK with 100% RB allocation, SAR is not required when the highest maximum output power for 100 % RB allocation is less than the highest maximum output power in 50% and 1 RB allocations and the highest reported SAR for 1 RB and 50% RB allocation are ≤ 0.8 W/kg. Otherwise, SAR is measured for the highest output power channel; and if the reported SAR is > 1.45 W/kg, the remaining required test channels must also be tested.
- 6. Per KDB 941225 D05v02r05, 16QAM output power for each RB allocation configuration is > not ½ dB higher than the same configuration in QPSK and the reported SAR for the QPSK configuration is ≤ 1.45 W/kg; Per KDB 941225 D05v02r05, 16QAM SAR testing is not required.
- 7. Per KDB 941225 D05v02r05, Smaller bandwidth output power for each RB allocation configuration is > not ½ dB higher than the same configuration in the largest supported bandwidth, and the reported SAR for the largest supported bandwidth is ≤ 1.45 W/kg; Per KDB 941225 D05v02r05, smaller bandwidth SAR testing is not required.
- 8. LTE band 2/4/5/17/38 SAR test was covered by Band 25/66/26/12/41; according to April 2015 TCB workshop, SAR test for overlapping LTE bands can be reduced if
  - a. the maximum output power, including tolerance, for the smaller band is ≤ the larger band to qualify for the SAR test exclusion
  - b. the channel bandwidth and other operating parameters for the smaller band are fully supported by the larger band
- 9. According to 2017 TCB workshop, for 64 QAM and 16 QAM should be verified by checking the signal constellation with a call box to avoid incorrect maximum power levels due to MPR and other requirements associated with signal modulation, and the following figure is taken from the "Fundamental Measurement >> Modulation Analysis >> constellation" mode of the device connect to the MT8821C base station, therefore, the device 64QAM and 16QAM signal modulation are correct.

# <TDD LTE SAR Measurement>

TDD LTE configuration setup for SAR measurement

SAR was tested with a fixed periodic duty factor according to the highest transmission duty factor implemented for the device and supported by 3GPP.

- a. 3GPP TS 36.211 section 4.2 for Type 2 Frame Structure and Table 4.2-2 for uplink-downlink configurations
- b. "special subframe S" contains both uplink and downlink transmissions, it has been taken into consideration to determine the transmission duty factor according to the worst case uplink and downlink cyclic prefix requirements for UpPTS
- c. Establishing connections with base station simulators ensure a consistent means for testing SAR and recommended for evaluating SAR. The Anritsu MT8820C (firmware: #22.52#004) was used for LTE output power measurements and SAR testing.

Figure 4.2-1: Frame structure type 2 (for 5 ms switch-point periodicity).

|   | Special subframe configuration                   | Normal cyclic prefix in uplink | Extended cyclic prefix in uplink |  |  |  |  |  |  |  |  |
| Uplink duty factor in one   | <b>Uplink duty factor in one 0~3</b> 7.13% 8.33% |                                |                                  |  |  |  |  |  |  |  |  |
| special subframe  | 4~7  | 14.3%                          | 16.7%                            |  |  |  |  |  |  |  |  |

The highest duty factor is resulted from:

- i. Uplink-downlink configuration: 0. In a half-frame consisted of 5 subfames, uplink operation is in 3 uplink subframes and 1 special subframe.
- ii. special subframe configuration: 5-9 for normal cyclic prefix in downlink, 4-7 for extended cyclic prefix in downlink
- iii. for special subframe with extended cyclic prefix in uplink, the total uplink duty factor in one half-frame is: (3+0.167)/5 = 63.3%
- iv. for special subframe with normal cyclic prefix in uplink, the total uplink duty factor in one half-frame is: (3+0.143)/5 = 62.9%
- v. For TDD LTE SAR measurement, the duty cycle 1:1.59 (62.9 %) was used perform testing and considering the theoretical duty cycle of 63.3% for extended cyclic prefix in the uplink, and the theoretical duty cycle of 62.9% for normal cyclic prefix in uplink, a scaling factor of extended cyclic prefix 63.3%/62.9% = 1.006 is applied to scale-up the measured SAR result. The scaled TDD LTE SAR = measured SAR (W/kg)\* Tune-up Scaling Factor\* scaling factor for extended cyclic prefix.
- vi. The device supports Power Class 3 uplink-downlink configurations 0 and 6, and Power Class 2 uplink-downlink configurations 1 to 5 operations for LTE Band 41.
- vii. The highest available duty cycle for Power Class 2 operation is 43.3% using UL-DL configuration 1, for Power Class 3 operation is 63.3% using UL-DL configuration 0. Per FCC Guidance, all SAR tests were performed using Power Class 3. SAR with Power Class 2 at the available duty factor was additionally performed for the Power Class 3 configuration with the highest SAR among all exposure condition.

# 10. SAR Test Results

#### **General Note:**

- Per KDB 447498 D01v06, the reported SAR is the measured SAR value adjusted for maximum tune-up tolerance.
  - a. Tune-up scaling Factor = tune-up limit power (mW) / EUT RF power (mW), where tune-up limit is the maximum rated power among all production units.

Report Number: SAR.20220613

- b. For SAR testing of WLAN signal with non-100% duty cycle, the measured SAR is scaled-up by the duty cycle scaling factor which is equal to "1/(duty cycle)"
- c. For WWAN: Reported SAR(W/kg)= Measured SAR(W/kg)\*Tune-up Scaling Factor
- d. For TDD LTE SAR measurement, the duty cycle 1:1.59 (62.9 %) was used perform testing and considering the theoretical duty cycle of 63.3% for extended cyclic prefix in the uplink, and the theoretical duty cycle of 62.9% for normal cyclic prefix in uplink, a scaling factor of extended cyclic prefix 63.3%/62.9% = 1.006 is applied to scale-up the measured SAR result. The Reported TDD LTE SAR = measured SAR (W/kg)\* Tune-up Scaling Factor\* scaling factor for extended cyclic prefix.
- 2. Per KDB 447498 D01v06, for each exposure position, testing of other required channels within the operating mode of a frequency band is not required when the *reported* 1-g or 10-g SAR for the mid-band or highest output power channel is:
  - ≤ 0.8 W/kg or 2.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≤ 100 MHz
  - ≤ 0.6 W/kg or 1.5 W/kg, for 1-g or 10-g respectively, when the transmission band is between 100 MHz and 200 MHz
  - ≤ 0.4 W/kg or 1.0 W/kg, for 1-g or 10-g respectively, when the transmission band is ≥ 200 MHz
- 3. Per KDB 865664 D01v01r04, for each frequency band, repeated SAR measurement is required only when the measured SAR is ≥0.8W/kg.

#### **UMTS Note:**

- 1. Per KDB 941225 D01v03r01, for SAR testing is measured using a 12.2 kbps RMC with TPC bits configured to all "1's".
- 2. Per KDB 941225 D01v03r01, RMC 12.2kbps setting is used to evaluate SAR. The maximum output power and tune-up tolerance specified for production units in HSDPA / HSUPA / DC-HSDPA is ≤ ¼ dB higher than RMC 12.2Kbps or when the highest reported SAR of the RMC12.2Kbps is scaled by the ratio of specified maximum output power and tune-up tolerance of HSDPA / HSUPA / DC-HSDPA to RMC12.2Kbps and the adjusted SAR is ≤ 1.2 W/kg, SAR measurement is not required for HSDPA / HSUPA / DC-HSDPA, and according to the following RF output power, the output power results of the secondary modes (HSUPA, HSDPA, DC-HSDPA) are less than ¼ dB higher than the primary modes; therefore, SAR measurement is not required for HSDPA / HSUPA / DC-HSDPA.

#### LTE Note:

- Per KDB 941225 D05v02r05, start with the largest channel bandwidth and measure SAR for QPSK with 1 RB allocation, using the RB offset and required test channel combination with the highest maximum output power for RB offsets at the upper edge, middle and lower edge of each required test channel.
- 2. Per KDB 941225 D05v02r05, 50% RB allocation for QPSK SAR testing follows 1RB QPSK allocation procedure.
- 3. Per KDB 941225 D05v02r05, For QPSK with 100% RB allocation, SAR is not required when the highest maximum output power for 100 % RB allocation is less than the highest maximum output power in 50% and 1 RB allocations and the highest reported SAR for 1 RB and 50% RB allocation are ≤ 0.8 W/kg. Otherwise, SAR is measured for the highest output power channel; and if the reported SAR is > 1.45 W/kg, the remaining required test channels must also be tested.
- 4. Per KDB 941225 D05v02r05, 16QAM output power for each RB allocation configuration is > not ½ dB higher than the same configuration in QPSK and the reported SAR for the QPSK configuration is ≤ 1.45 W/kg; Per KDB 941225 D05v02r05, 16QAM SAR testing is not required.
- Per KDB 941225 D05v02r05, Smaller bandwidth output power for each RB allocation configuration is > not ½ dB higher than the same configuration in the largest supported bandwidth, and the reported SAR for the largest supported bandwidth is ≤ 1.45 W/kg; Per KDB 941225 D05v02r05, smaller bandwidth SAR testing is not required.
- For LTE B4/B5/B12/B17 the maximum bandwidth does not support three non-overlapping channels, per KDB 941225 D05v02r05, when a device supports overlapping channel assignment in a channel bandwidth configuration, the middle channel of the group of overlapping channels should be selected for testing.
- 7. LTE band 4/17 SAR test was covered by Band 66/12; according to TCB workshop, SAR test for overlapping LTE bands can be
  - a. The maximum output power, including tolerance, for the smaller band is  $\leq$  the larger band to qualify for the SAR test exclusion.
  - b. The channel bandwidth and other operating parameters for the smaller band are fully supported by the larger band.

# 11. Simultaneous Transmission Analysis

All the data below is referenced from the original reports under FCC ID: PKRISGM3000A in report numbers SAR.20220610 and SAR.20220611 for the 3G/4G/WiFi and FR1. The FR2 data is from the report number SAR.20220615 contained in this filing. The data listed in the tables below was extracted from these reports.

### Sim-Tx configuration

| Ma  | Cimulton con Transmission Confirmation      | Exposure Positions |
|-----|---|--------------------|
| No. | Simultaneous Transmission Configuration     | Body               |
| 1   | UMTS + 2.4 GHz Wifi 0 + 2.4 GHz WiFi 1      | Yes                |
| 2   | UMTS + 5 GHz Wifi 0 + 5 GHz WiFi 1          | Yes                |
| 3   | LTE + 2.4 GHz Wifi 0 + 2.4 GHz WiFi 1       | Yes                |
| 4   | LTE + 5 GHz Wifi 0 + 5 GHz WiFi 1           | Yes                |
| 5   | FR1 + 2.4 GHz Wifi 0 + 2.4 GHz WiFi 1       | Yes                |
| 6   | FR1 + 5 GHz Wifi 0 + 5 GHz WiFi 1           | Yes                |
| 7   | LTE + FR2 + 2.4 GHz WiFi 0 + 2.4 GHz WiFi 1 | Yes                |
| 8   | LTE + FR2 + 5 GHz WiFi 0 + 5 GHz WiFi 1     | Yes                |

#### **General Note:**

- The worst case WLAN reported SAR for each configuration was used for SAR summation, regardless of whether the WLAN channel has Hotspot capability. Therefore, the following summations represent the absolute worst cases for simultaneous transmission with WLAN.
- 2. The Scaled SAR summation is calculated based on the same configuration and test position.

### 13. Conclusion

The SAR measurement indicates that the EUT complies with the RF radiation exposure limits of the FCC/IC. These measurements are taken to simulate the RF effects exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The tested device complies with the requirements in respect to all parameters subject to the test. The test results and statements relate only to the item(s) tested.

Please note that the absorption and distribution of electromagnetic energy in the body is a very complex phenomena that depends on the mass, shape, and size of the body; the orientation of the body with respect to the field vectors; and, the electrical properties of both the body and the environment. Other variables that may play a substantial role in possible biological effects are those that characterize the environment (e.g. ambient temperature, air velocity, relative humidity, and body insulation) and those that characterize the individual (e.g. age, gender, activity level, debilitation, or disease). Because innumerable factors may interact to determine the specific biological outcome of an exposure to electromagnetic fields, any protection guide shall consider maximal amplification of biological effects as a result of field-body interactions, environmental conditions, and physiological variables.

Peak SAR (extrapolated) = 11.2 W/kg

P<sub>in</sub>= 100 mW

**SAR(1 g) = 5.66 W/kg; SAR(10 g) = 2.49 W/kg** Maximum value of SAR (measured) = 9.16 W/kg

# RF Exposure Lab

# Plot 6

DUT: Dipole D3500V2; Type: D3500V2; Serial: D3500V2 - SN: 1061

Communication System: CW; Frequency: 3500 MHz; Duty Cycle: 1:1

Medium: HSL 3-6 GHz; Medium parameters used: f = 3500 MHz;  $\sigma = 2.94$  S/m;  $\epsilon_r = 37.16$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

Test Date: Date: 6/12/2022; Ambient Temp: 23 °C; Tissue Temp: 21 °C Probe: EX3DV4 – SN3662; ConvF(6.73, 6.73, 6.73); Calibrated: 2/16/2022;

Sensor-Surface: 2mm (Mechanical Surface Detection) Electronics: DAE4 Sn1416; Calibrated: 4/12/2022 Phantom: ELI v5.0; Type: QDOVA002AA; Serial: 2037

Measurement SW: DASY52, Version 52.10 (0); SEMCAD X Version 14.6.10 (7417)

#### **Procedure Notes:**

**3500 MHz Head/Verification/Area Scan (7x9x1):** Measurement grid: dx=10mm, dy=10mm Maximum value of SAR (measured) = 1.59 W/kg

3500 MHz Head/Verification/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=4mm, dy=4mm, dz=4mm

Reference Value = 15.268 V/m; Power Drift = -0.02 dB

Peak SAR (extrapolated) = 3.66 W/kg

Pin= 10 mW

SAR(1 g) = 0.675 W/kg; SAR(10 g) = 0.254 W/kg Maximum value of SAR (measured) = 1.69 W/kg
