

Here is some more SAR question:

1. SAR was tested using 1800 MHz head probe factor for 1900 MHz body. Please submit estimate of change in SAR if correct probe factors had been used, including details of any conversion calculations and system manufacturer's scaling rules-of-thumb.

2. Our intent is to add conditions to this existing grant, similar to: "Output is EIRP. Device must operate in laptop computer configurations similar to as described in this filing. Device has been tested for SAR compliance. The highest reported SAR value is 1.xx W/kg."

To do this we have to do a temporary grant setaside. Drop us an email or phone call when all of your data is available for upload. Then you watch for setaside, at which time you will have a window to upload. Then we will correct and re-issue grant.
