

## *Measurement of MPE*

### 1. Foreword

In adopt with the Human Exposure IEEE C95.1, and according to the FCC 1.1310. The *Maximum Permissible Exposure (MPE)* is obligated to measure in order to prove the safety of radiation harmfulness to the human body.

The *Gain* of the antenna used is measured in an *Anechoic chamber*. The *maximum total power to the antenna* is to be recorded. By adopting the *Friis Transmission Formula* and the *power gain of the antenna*, we can find the distance right away from the product, where the limit of the MPE is.

### 2. Description of EUT

<b>EUT</b>	:	Cable Gateway
<b>Classification</b>	:	Mobile Device
		(i) Under normal use condition, the antenna is at least 20cm away from the user;
		(ii) Warning statement for keeping 20cm separation distance and the prohibition of operating next to the person has been printed in the user's manual
<b>Model No.</b>	:	BEFCMUH4
<b>Granted FCC ID</b>	:	PKW-BEFCMUH4
<b>Frequency Range</b>	:	2.412 GHz ~ 2.462GHz
<b>Supported Channel:</b>		11 Channel
<b>Modulation Skill</b>	:	DBPSK, DQPSK, CCK
<b>Power Type</b>	:	Powered by the AC-DC adapter
		M/N: DSA-0151A-12
		Input: 100-120VAC, 50Hz-60Hz, 40VA
		Output: +12VDC, 1.25A
<b>Applicant</b>	:	The Linksys Group, Inc.
		17401 Armstrong Ave., Irvine, CA 92614, U.S.A.

**3. Limits for Maximum Permissible Exposure (MPE)**

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (H) (A/m)	Power Density (S) (mW/cm <sup>2</sup> )	Averaging Time  E  <sup>2</sup> ,  H  <sup>2</sup> or S (minutes)
<b>(A) Limits for Occupational/Controlled Exposure</b>				
0.3-3.0	614	1.63	100	6
3.0-30	1842/f	4.89/f	900/f <sup>2</sup>	6
30-300	61.4	0.163	1.0	6
300-1500	--	--	f/300	6
1500-100,000	--	--	5	6
<b>(B) Limits for General Population/Uncontrolled Exposure</b>				
0.3-1.34	614	1.63	100	30
1.34-30	824/f	2.19/f	180/f <sup>2</sup>	30
30-300	27.5	0.073	0.2	30
300-1500	--	--	f/1500	30
1500-100,000	--	--	1.0	30

[The EUT is tested in transmit and receive modes and in the first, middle and the last channel separately. The following shows only our observation have the greatest emissions.]

According to OET BULLETIN 56 Fourth Edition/August 1999, equation for predicting RF fields, by the Friis Transmission Formula:

$$\text{Power density at the specific separation (portable): } S = \frac{PG}{4pR^2} = \frac{33.96 \times 0.79}{4p(20)^2} = 5.337 \times 10^{-3} \text{ mW / cm}^2$$

$$\text{Estimated safe separation: } R = \sqrt{\frac{PG}{4p}} = \sqrt{\frac{33.96 \times 0.79}{4p}} = 1.461 \text{ cm}$$

Remarks: "The safe estimated separation that the user must maintain from the antenna is at least 1.461 cm."

Where: S = power density (in appropriate units, e.g. mW/cm<sup>2</sup>)

P = power input to the antenna (in appropriate units, e.g., mW)

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna (appropriate units, e.g., cm)

The Numeric gain G of antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1} (\text{dB antenna gain}/10)$$

$$G = \text{Log}^{-1} (-1 / 10) = 0.79$$
