## 7. TEST RESULTS

### 7.1 ANTENNA REQUIREMENTS

#### TEST REQUIREMENT

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of Sections 15.211, 15.213, 15.217, 15.219, or 15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with Section 15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this Part are not exceeded.

- 2) The turntable shall rotate from 0° to 360° degrees to determine the position of maximum emission level.
- 3) The EUT is positioned 3 m away from the receiving antenna which varied from 1 to 4 m to find the highest emission.
- 4) The measurements were made with the detector set to PEAK and AVERAGE amplitude within a bandwidth of 100 kHz below 1000 MHz and 1 MHz above 1000 MHz.
- 5) The receiving antenna was positioned in both horizontal and vertical polarization.
- 6) The measurements with Quasi-Peak detector, below 1000 MHz are performed only for frequencies for which the Peak values are  $\geq$  (Q.P. limit – 6 dB).

## 7.4 CHARACTERISTICS OF TRANSMISSION

### TEST REQUIREMENT § 15.231 (A)

The provisions of this Section are restricted to periodic operation within the band 40.66 -MHz and above 70 MHz. Except as shown in paragraph (e) of this Section, the intentional radiator restricted to the transmission of a control signal such as those used with alarm systems, door openers, remote switches, etc. Continuous transmissions, voice, video and the radio control of toys are not permitted. Data is permitted to be sent with a control signal. The following conditions shall be met to comply with the provisions for this periodic operation:

- (1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.
- (2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.
- (3) Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour.
- (4) Intentional radiators which are employed for radio control purposes during emergencies involving fire, security, and safety of life, when activated to signal an alarm, may operate during the pendency of the alarm condition.
- (5) Transmission of set-up information for security systems may exceed the transmission duration limits in paragraphs (a)(1) and (a)(2) of this section, provided such transmission are under the control of a professional installer and do not exceed ten seconds after a manually operated switch is released or a transmitter is activated automatically. Such set-up information may include data.

EUT operating condition	#2
Testing dates	2018-06-18

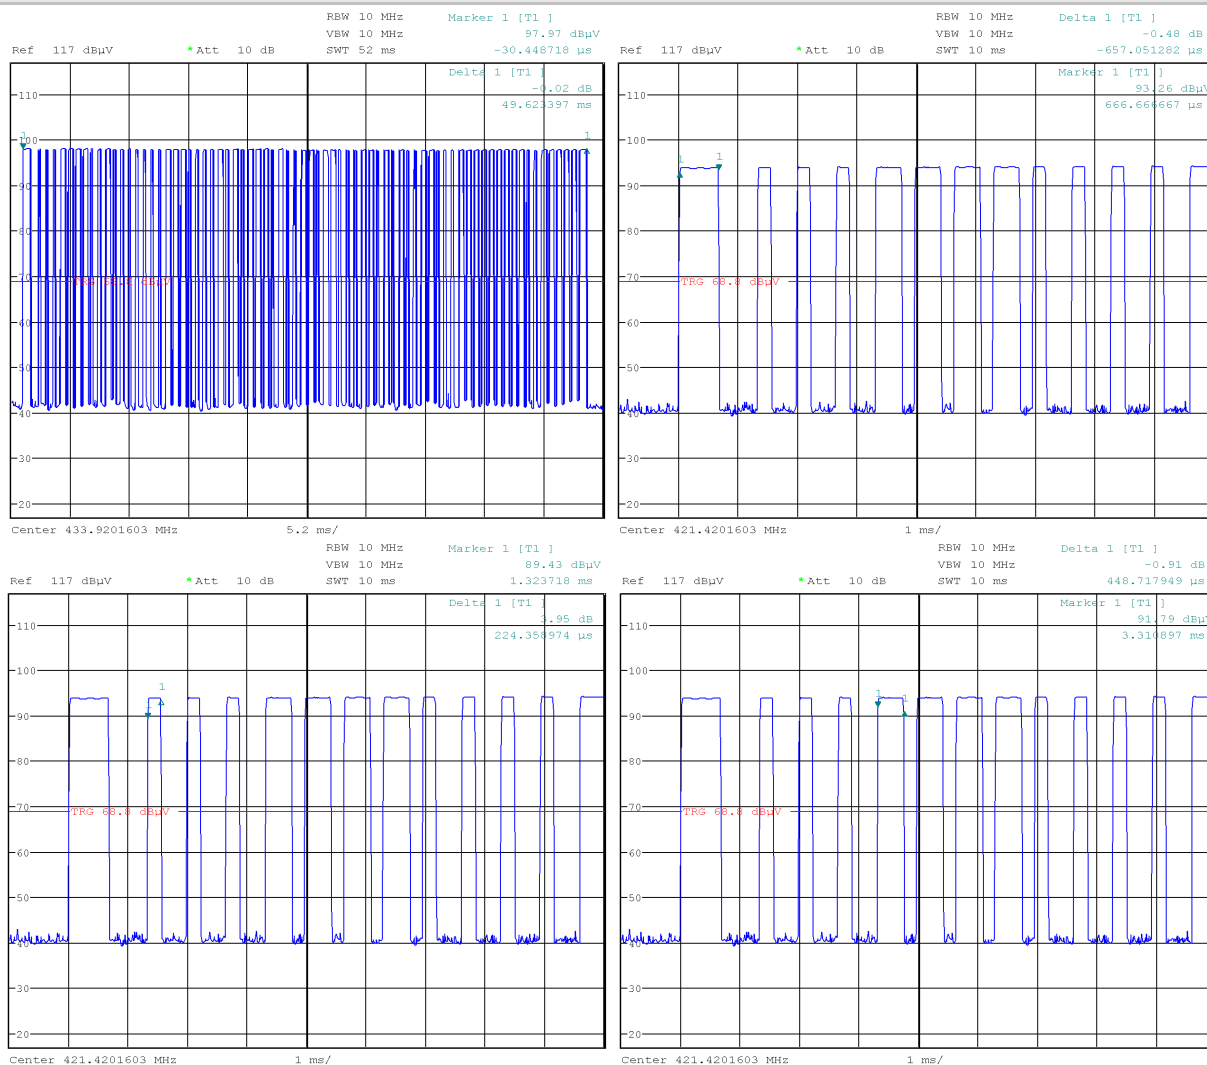

### LIMITS

TX time < 5 s

### TEST RESULT

The EUT meets the requirements of sections 15.231 (a)

## MEASUREMENTS RESULTS

After activation of transmission the equipment send 5 codes and then ceases the transmission.

Code: a train of 74 pulses (1 bit Start, 72 bits, 1 bit Stop) lasting 49.5ms followed by a pause of 50.5ms.

Start BIT = ON\_0.66ms + OFF\_0.66ms

52 bits: 1: ON\_0.44ms + OFF\_0.22ms or 0: ON\_0.22ms + OFF\_0.44ms

Stop BIT = ON\_0.66ms

T<sub>total train</sub> = 49.5 ms + 50.5ms = 100ms

Average factor, in the worst case, with all bits equal to 1:

T<sub>ON</sub> = (0.66 + 52\*0.44 + 0.66) ms = 33.0ms

Duty-cycle in 100ms = 33 / 100 = 0.33

Correction for average = 20 x log (0.33) = -9.63 dB

**Cease transmission within 5 seconds after activation**
