DASY

Dipole Validation Kit

Type: D835V2

Serial: 441

Manufactured:

March 9, 2001

Calibrated:

October 3, 2003

Report No.: HCT-SAR03-1201 FCC ID: PP4TX-120C DATE: December 29, 2003

1. Measurement Conditions

The measurements were performed in the flat section of the SAM twin phantom filled with **head** simulating solution of the following electrical parameters at 835 MHz:

Relative Dielectricity 43.0 \pm 5% Conductivity 0.90 mho/m \pm 5%

The DASY4 System with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 6.7 at 835 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 15mm from dipole center to the solution surface. The included distance spacer was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration.

The dipole input power (forward power) was 250 mW \pm 3 %. The results are normalized to 1W input power.

2. SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the <u>advanced extrapolation</u> are:

averaged over 1 cm 3 (1 g) of tissue: 9.24 mW/g \pm 16.8 % (k=2) 1

averaged over 10 cm³ (10 g) of tissue: **6.08 mW/g** \pm 16.2 % (k=2)¹

1 validation uncertainty

Report No.: HCT-SAR03-1201 FCC ID: PP4TX-120C DATE: December 29, 2003

3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:

1.377 ns (one direction)

Transmission factor:

0.983

(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance spacer was in place during impedance measurements.

Feedpoint impedance at 835 MHz:

 $Re{Z} = 52.0 \Omega$

Im $\{Z\} = -6.1 \Omega$

Return Loss at 835 MHz

-24.1 dB

4. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

5. Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

6. Power Test

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

DASY

Dipole Validation Kit

Type: D1900V2

Serial: 5d032

Manufactured:

March 17, 2003

Calibrated:

May 12, 2003

FCC ID: PP4TX-120C **DATE**: December 29, 2003 Report No.: HCT-SAR03-1201

Measurement Conditions

The measurements were performed in the flat section of the SAM twin phantom filled with head simulating solution of the following electrical parameters at 1900 MHz:

Relative Dielectricity ±5% Conductivity 1.44 mho/m ± 5%

The DASY4 System with a dosimetric E-field probe ET3DV6 (SN:1507, Conversion factor 5.2 at 1900 MHz) was used for the measurements.

The dipole was mounted on the small tripod so that the dipole feedpoint was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10mm from dipole center to the solution surface. The included distance holder was used during measurements for accurate distance positioning.

The coarse grid with a grid spacing of 15mm was aligned with the dipole. The 7x7x7 fine cube was chosen for cube integration.

The dipole input power (forward power) was 250 mW ± 3 %. The results are normalized to 1W input power.

SAR Measurement with DASY4 System

Standard SAR-measurements were performed according to the measurement conditions described in section 1. The results (see figure supplied) have been normalized to a dipole input power of 1W (forward power). The resulting averaged SAR-values measured with the dosimetric probe ET3DV6 SN:1507 and applying the advanced extrapolation are:

averaged over 1 cm³ (1 g) of tissue: 42.0 mW/g \pm 16.8 % (k=2)¹

averaged over 10 cm³ (10 g) of tissue: 21.6 mW/g \pm 16.2 % (k=2)¹

1 validation uncertainty

Report No.: HCT-SAR03-1201 FCC ID : PP4TX-120C DATE : December 29, 2003

3. Dipole Impedance and Return Loss

The impedance was measured at the SMA-connector with a network analyzer and numerically transformed to the dipole feedpoint. The transformation parameters from the SMA-connector to the dipole feedpoint are:

Electrical delay:

1.195 ns (one direction)

Transmission factor:

0.980

(voltage transmission, one direction)

The dipole was positioned at the flat phantom sections according to section 1 and the distance holder was in place during impedance measurements.

Feedpoint impedance at 1900 MHz:

 $Re{Z} = 50.5 \Omega$

Im $\{Z\} = 3.2 \Omega$

Return Loss at 1900 MHz

-29.9 dB

4. Handling

Do not apply excessive force to the dipole arms, because they might bend. Bending of the dipole arms stresses the soldered connections near the feedpoint leading to a damage of the dipole.

Design

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals.

Small end caps have been added to the dipole arms in order to improve matching when loaded according to the position as explained in Section 1. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

Power Test

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.
