Maximum value of SAR (measured) = 7.85 mW/g

**Test Configurations**

In normal operation, the EUT will be placed in a host device. Per FCC KDB 447498 D01 v04, Item 2(a)(i)

**"A device may be used in portable exposure conditions with no restrictions on host platforms when either the source-based time-averaged output power is  $\leq 60/f(\text{GHz})$  mW or all measured 1-g SAR are  $< 0.4 \text{ W/kg}$ . When SAR evaluation is required, the most conservative exposure conditions for all expected operating configurations must be tested."**

To provide the maximum flexibility, the EUT was tested at the most conservative (worst case) distance of 1.1cm as specified by the client, Electric Imp.

**Duty Factor**

All testing was performed with the EUT configured in a worst-case configuration and operating mode to produce the highest SAR levels. The EUT used Electric Imp test software that permitted the selection of transmit channel, modulation type, and data rate. It operated continuously at its maximum duty cycle of 77%. The maximum duty cycle of 77% is a hardware limitation.

**Summary**

The following tables summarize the measured SAR values.

Per FCC KDB 248227, among the channels required for normal testing, SAR must be measured on the channel with the highest conducted output power. When the SAR measured on the highest output channel is  $> 0.8 \text{ W/kg}$ , SAR evaluation for the other required test channels is necessary.
