1 General information

1.1 Notes

The test results of this test report relate exclusively to the test item specified in 3.1.1. The CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalisations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of the CETECOM ICT Services GmbH.

3 Technical tests

3.1 Details of manufacturer

Name:	Philips Medizin Systeme Böblingen GmbH
Street:	Hewlett-Packard-Strasse 2
Town:	71034 Böblingen
Country:	Germany

3.1.1 Test item

Kind of test item :	SRR Module
Type identification :	Short Range Radio Module intended for IntelliVUE X2
S/N serial number :	RA 849 000044 (Transceiver) DE83617447 (host monitor IntelliVUE X2)
HW hardware status :	M3002-66471 Rev 0850
SW software status :	-/-
Frequency Band [MHz] :	2400 – 2483.5 MHz
Type of Modulation :	DSSS
Emission Designator :	5M00G1D
Channel Separation :	5 MHz
Number of channels :	16
Antenna :	Integrated on board antenna
Power Supply :	10.80 V DC by Li-Ion Battery
Temperature Range :	22 °C

Transceiver 1:

Max. power radiated: **-11.00 dBm / 0,08 mW**
 Max. power conducted: **not performed**

Transceiver 2:

Max. power radiated: **-5.00 dBm / 0,32 mW**
 Max. power conducted: **not performed**

FCC ID: **PQC-SRRBV1**
 IC: **3549C-SRRBV1**

SAR/RF Exposure Statement:

According to the FCC and IC regulations SAR/RF exposure tests are not required because the maximum radiated output power of the Short Range Radio module is 0.32 mW. This value is far below the SAR/RF exposure limit of 25 mW (60/F[GHz]).

3.1.2 Additional EUT information For IC Canada (appendix 2)

IC Registration Number:	3549C-SRRBV1
Model Name:	Short Range Radio Module
Manufacturer (complete Adress):	Philips Medizin Systeme Böblingen GmbH Hewlett-Packard-Strasse 2 71034 Böblingen Germany
Tested to Radio Standards Specification (RSS) No.:	RSS-210 Issue 7
Open Area Test Site Industry Canada Number:	IC 3463A-1
Frequency Range (or fixed frequency) [MHz]:	2400 – 2483.5 MHz
RF: Power [W] (max):	<p>Transceiver 1: Rad. EIRP: 0.08mW</p> <p>Transceiver 1: Rad. EIRP: 0.32mW</p>
Antenna Type:	Integrated on board antenna
Occupied Bandwidth (99% BW) [kHz]:	Not performed
Type of Modulation:	DSSS
Emission Designator (TRC-43):	2M69G1D (DSSS)
Transmitter Spurious (worst case) [μ V/m in 3m]:	130
Receiver Spurious (worst case) [μ V/m in 3m]:	118

ATTESTATION: I attest that the testing was performed or supervised by me; that the test measurements were made in accordance with the above-mentioned departmental standard(s), and that the radio equipment identified in this application has been subject to all applicable test conditions specified in the departmental standards and all of the requirements of the standards have been met.

5 RF measurement testing

5.1 Description of test set-up

5.1.1 Radiated measurements

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 20 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are confirmed with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test set-ups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received.

The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.4-2003 clause 4.2.

Antennas are confirmed with ANSI C63.2-1996 item 15.

9 kHz - 150 MHz: Quasi Peak measurement, 200 Hz Bandwidth, passive loop antenna.

150 kHz - 30 MHz: Quasi Peak measurement, 9 kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120 kHz Bandwidth, biconical antenna

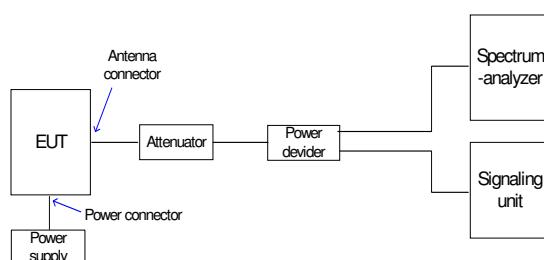

200MHz - 1GHz: Quasi Peak measurement, 120 kHz Bandwidth, log periodic antenna

>1GHz: Average, RBW 1MHz, VBW 10 Hz, wave guide horn

All measurement settings are according to FCC 15.209 and 15.207

5.1.2 Conducted measurements

The EUT's RF signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is connected to the spectrum analyzer. The specific losses for signal path are first checked within a calibration. The measurement readings on the spectrum analyzer are corrected by the specific test set-up loss. The attenuator, power divider, signalling unit and the spectrum analyzer are impedance matched on 50 Ohm.

5.2 Referenced Documents

The compliance tests on the Short Range Radio (SRR) module for the IntelliVue Patient Monitors MP5 and MP5T, according to the FCC and IC regulations are documented in the following test reports:
No.: 1-0384-01-03-08-C (all tests, SRR stand-alone) and No.: 1-0384-01-09-08-B (additional tests, SRR built-in in host monitor).

5.3 Additional comments

The Short Range Radio (SRR) module tested in this report includes two similar transceivers arranged on one common PCB, see pictures 10 to 13 in sec 8 of this test report.

The manufacturer provided software which was used to set the channel (modulated or un-modulated) and the output power to get the EUT in continuous transmitting mode.

Every test was performed with the highest output power and modulated carrier.

The module is only used in hosts from the following manufacturer:
Philips Medizin Systeme Böblingen

The SRR module covered by this report is intended for the IntelliVue MP2/X2.

The SRR module covered by the report referenced in section 5.2 is intended for the IntelliVue MP5/MP5T

Complete compliance tests to the FCC and IC regulations were performed on the SRR module intended for the IntelliVue Patient Monitors, models MP5 and MP5T. The performed testing included tests on the SRR module stand-alone and built-in in the host monitor, as documented in the test reports referenced in Sec. 5.2 above.

The SRR module intended for use in the IntelliVue models MP2 and X2 was slightly modified due to the limited space availability in these monitors. The modification of the SRR module comprises the following:

➤ Components

RF processor and clock oscillator are identical.

The MP5/MP5T radio uses a “WE-MCA” chip antenna (part no. 7488920245) from Würth Elektronik for both radio modules on that board.

The MP2/X2 radio uses two different chip antennas:

- “Micro Reach Xtend” chip antenna (part no. FR05-S1-N-0-110) from Fractus for radio 1
- “Comata” chip antenna (part no. 3030A6111) from Antenova

Likewise the antenna matching circuit has been adapted for the different antennas.

As a reference, the specified antenna gains for the used antennas are:

- Würth “WE-MCA”: 1.3 dBi peak, 0.0 dBi average
- Fractus “Micro Reach Xtend”: - 0.5 dBi peak
- Antenova “Comata”: 0.0 dBi peak, -3.5 dBi average

Details of the schematics can be seen in drawings D-M8100-96471-1 rev. 0818 (MP5/MP5T) and D-M3002-96471-1 rev. 0850 (MP2/X2).

➤ **Placement and PCB Layout**

Placement and PCB layout have been adjusted to the different space restrictions inside the IntelliVue MP2/X2.

Details of the placement can be seen in drawing C-M8100-66491-8 rev. 0818 (MP5/MP5T) and C-M3002-66471-8 rev. 0831 (MP2/X2).

The referenced documents are kept on file at CETECOM ICT"

Class A spurious emissions tests were carried out at the lowest, middle and highest operating frequency and in idle mode. Additionally, the hosting monitor was tested alone without the short range radio module in order to distinguish the spurious emissions of the transmitter module from those originated by the class A hosting monitor.

IntelliVue MP2 Reference

The IntelliVue MP2 is the marketing variant of the IntelliVue X2, which provides reduced functionality. Both monitor models, the MP2 and the X2, have the same hardware and software.

Compared to the X2, the MP2 lacks the capability to communicate directly with another IntelliVue patient monitor.

For this reason, all radio tests performed on the X2 are also representative for the MP2.

5.4 Antenna gain

The antenna gain of the complete system is calculated by the difference of radiated power in EIRP and the conducted power of the module.

Not performed

	low channel	mid channel	high channel
Conducted power [dBm] <i>(measured)</i>			
Radiated power [dBm] <i>(measured)</i>			
Gain [dBi] <i>(calculated)</i>			

5.5 Peak Power Spectral density (digitally modulated systems) §15.247(e)**Not performed**

Limits :

Under normal test conditions only	For digitally modulated systems, the peak power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission
-----------------------------------	---

5.6 Spectrum Bandwidth of a DSSS System / 6 dB Bandwidth §15.247(a)(2)**Not performed**

Results:

Test conditions		6 dB BANDWIDTH [MHz]		
Frequency [MHz]				
T_{nom}	V_{nom}			
Measurement uncertainty		$\pm 1\text{kHz}$		

RBW: 100 kHz / VBW 100 kHz

Limits:

Under normal test conditions only	> 500 kHz
-----------------------------------	-----------

5.7 Spectrum Bandwidth of a DSSS System / 20 dB Bandwidth

Not performed

Results:

Test conditions		20 dB BANDWIDTH [MHz]		
Frequency [MHz]				
T _{nom}	V _{nom}			
Measurement uncertainty		±1kHz		

RBW: 100 kHz / VBW 100 kHz

5.8 Maximum output power (conducted) §15.247 (b)(3)

Not performed

Results:

Test conditions		Max. peak output power [dBm]		
Frequency [MHz]				
T _{nom}	V _{nom}	PK PK corrected		
De facto EIRP (Peak) [dBm]				
Antenna gain: [dBi]				
Measurement uncertainty		±3dB		

RBW / VBW: 10 MHz

Limits:

Under normal test conditions only, for frequency range 2400-2483.5 MHz	Max. 1.0 Watt / 30 dBm
--	------------------------

MPE calculation

These equations are generally accurate in the far field of an antenna but will over predict power density in the near field, where they could be used for making a “worst case” prediction.

$$S = PG/4\pi R^2$$

where S = power density (in appropriate units, e.g. mW/cm²)

P = power input to the antenna (in appropriate units e.g. mW)

G = power gain of the antenna in the direction of interest relative to the isotropic radiator

R = distance to the centre of radiation of the antenna (appropriate units e.g. cm)

Or

$$S = EIRP/4\pi R^2$$

where $EIRP$ = equivalent isotropically radiated power

Calculation:

(Calculated for max. EIRP)

EIRP: -5.00 dBm (0.32 mW)

calculated at distance of 20 cm:

$$\text{power density} = 0.32/4\pi 20^2 = 0.0064 \text{ mW/cm}^2$$

Limit:

1mW/cm² is the reference level for general public exposure according to the OET Bulletin 65,
Edition 97-01 Table 1.

5.9 Max. peak output power (radiated) §15.247 (b)(3)

Transceiver 1:

Results:

Test conditions		Max. peak output power EIRP [dBm]		
Frequency [MHz]		Lowest frequency	Middle frequency	Highest frequency
T _{nom}	V _{nom}	-13.00	-15.00	-11.00
Measurement uncertainty		±3dB		

Transceiver 2:

Results:

Test conditions		Max. peak output power EIRP [dBm]		
Frequency [MHz]		Lowest frequency	Middle frequency	Highest frequency
T _{nom}	V _{nom}	-8.60	-5.00	-5.00
Measurement uncertainty		±3dB		

RBW / VBW: 10 MHz

Measured at a distance of 3m

Limits:

Under normal test conditions only, for frequency range 2400-2483.5 MHz	Max. 1.0 Watt
--	---------------

5.10 Band-edge compliance of conducted emissions §15.247 (d)**Not performed**

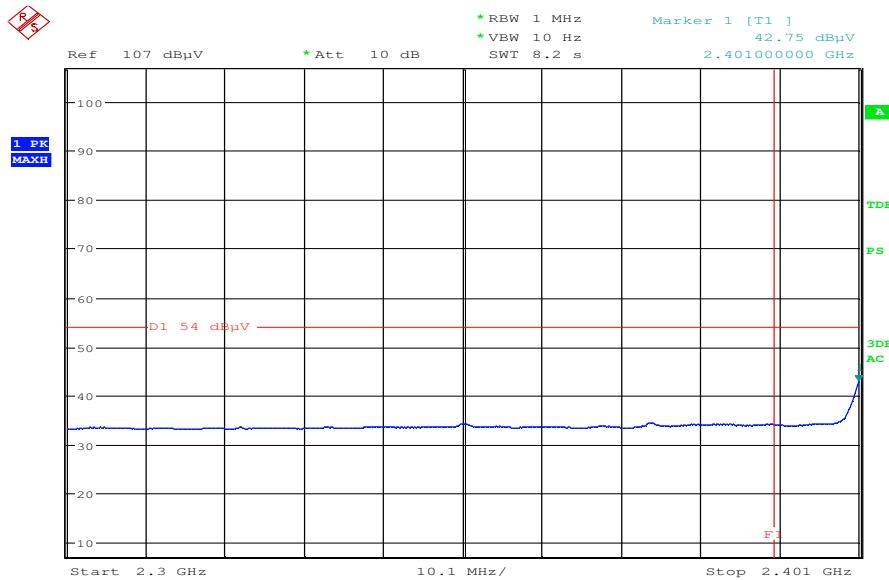

Limits:

Under normal test conditions only	In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 5.205(c)).
-----------------------------------	--

5.11 Band-edge compliance of radiated emissions §15.205

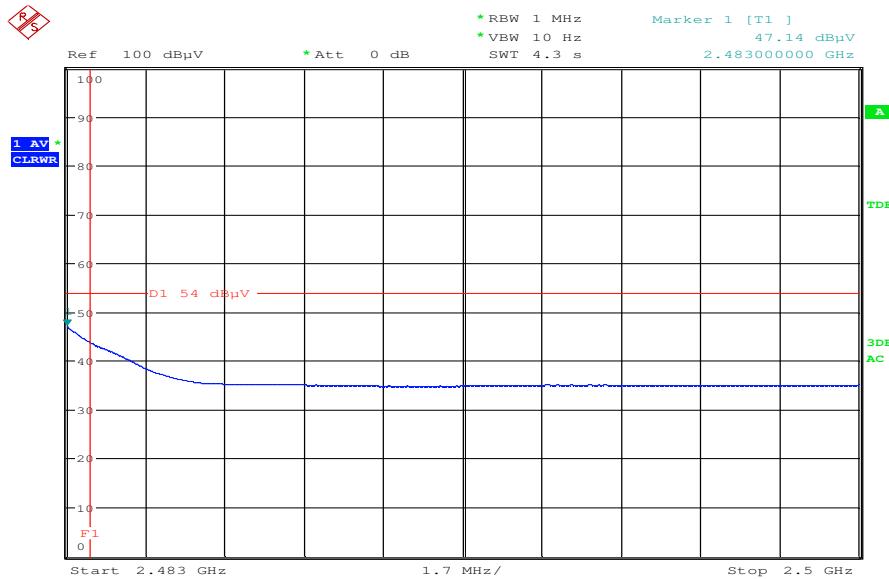

Transceiver 1:

Plot 1: Band edge compliance with far away spurious emissions (Lowest Channel)

6 Test equipment and ancillaries used for tests

To simplify the identification on each page of the test equipment used, on each page of the test report, each item of test equipment and ancillaries such as cables are identified (numbered) by the Test Laboratory, below.

All reported calibration intervals are calibrations according to the EN/ISO/IEC 17025 standard. These calibrations were performed from an accredited external calibration laboratory.

Additional to these calibrations the laboratory performed comparison measurements with other calibrated systems and performed a weekly chamber inspection.

All used devices are connected with a 10 MHz external reference.

According to the manufacturers' instruction is it possible to establish a calibration interval for the FSP unit of 24 month, if the device has an external 10 MHz reference.
