For the PCB antenna 2 are only delta measurements performed.

## 5 RF measurement testing

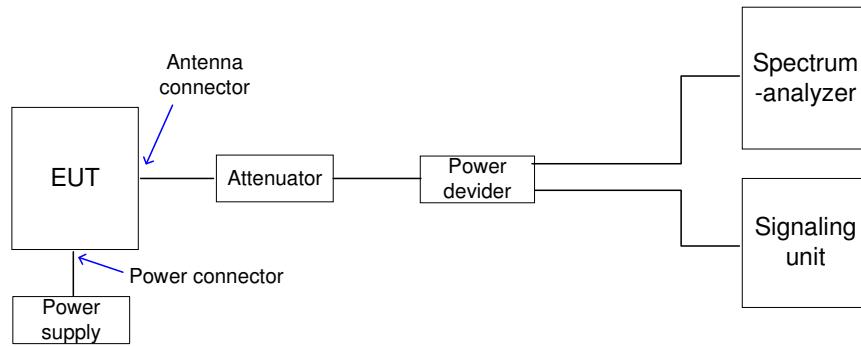

### 5.1 Description of test set-up

#### 5.1.1 Radiated measurements

### 5.1.2 Conducted measurements

The EUT's RF signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is connected to the spectrum analyzer. The specific losses for signal path are first checked within a calibration. The measurement readings on the spectrum analyzer are corrected by the specific test set-up loss. The attenuator, power divider, signalling unit and the spectrum analyzer are impedance matched on 50 Ohm.

## 5.2 Referenced Documents

None

## 5.3 Additional comments

For the PCB antenna 2 are only delta measurements performed.

The followings power settings are declared by the manufacture. All measurements are performed with the specified settings.

## 5.4 Manufacturer's declaration

The manufacturer attests that the power settings used for testing are part of the firmware and cannot be changed by the user or host. These settings are specific for different countries and are related to the local requirements. The following measurements were performed with the specific power settings fulfilling the requirements of the FCC- and IC- rules.

## 5.5 Antenna gain

The antenna gain of the complete system is calculated by the difference of radiated power in EIRP and the conducted power of the module.

|  | low channel | mid channel  | high channel |
|--|-------------|--------------|--------------|
| Conducted power [dBm]<br><i>(measured)</i> | 18.08       | <b>19.28</b> | 17.61        |
| Radiated power [dBm]<br><i>(measured)</i>  | 18.59       | <b>19.51</b> | 17.39        |

**MPE calculation**

These equations are generally accurate in the far field of an antenna but will over predict power density in the near field, where they could be used for making a “worst case” prediction.

$$S = PG/4\pi R^2$$

where S = power density (in appropriate units, e.g. mW/cm<sup>2</sup>)

P = power input to the antenna (in appropriate units e.g. mW)

G = power gain of the antenna in the direction of interest relative to the isotropic radiator

R = distance to the centre of radiation of the antenna (appropriate units e.g. cm)

Or

$$S = EIRP/4\pi R^2$$

where EIRP = equivalent isotropically radiated power

**Calculation:**

(Calculated for max. EIRP)

EIRP: 23.68 dBm (233.35 mW)

calculated at distance of 20 cm:

$$\text{power density} = 233.35/4\pi 20^2 = 0.0464 \text{ mW/cm}^2$$

Limit:

1mW/cm<sup>2</sup> is the reference level for general public exposure according to the OET Bulletin 65,  
Edition 97-01 Table 1.

## 6 Test equipment and ancillaries used for tests

To simplify the identification on each page of the test equipment used, on each page of the test report, each item of test equipment and ancillaries such as cables are identified (numbered) by the Test Laboratory, below.

All reported calibration intervals are calibrations according to the EN/ISO/IEC 17025 standard. These calibrations were performed from an accredited external calibration laboratory.

Additional to these calibrations the laboratory performed comparison measurements with other calibrated systems and performed a weekly chamber inspection.

All used devices are connected with a 10 MHz external reference.

According to the manufacturers' instruction is it possible to establish a calibration interval for the FSP unit of 24 month, if the device has an external 10 MHz reference.
