### 1. General Description

The A7105 is a high performance and low cost 2.4GHz ISM band wireless transceiver. It integrates both high sensitivity receiver and high efficiency power amplifier (up to 1dBm). In low data rate application, A7105 has special strength for long LOS (line-of-sight) distance because of its super high sensitivity (-107 dBm @ 2Kbps) with no requirement of external LNA or PA. Based on chip fraction-N synthesizer, it can support on-air data rates from 2Kbps to 500Kbps. For packet handling, A7105 supports 64 bytes data FIFO, CRC detection, FEC error correction. In addition, 8-bits RSSI for clear channel assessment and data whitening for data encryption/decryption. That makes A7105 easy to be used together with a low cost and low speed micro-controller (MCU). All features are integrated in a small QFN 4X4 20 pins package.

One unique command set is called **Strobe command** via 3-wire or 4-wire SPI interface, MCU could access A7105's control registers and state machine for all radio control like TX delivery, RX receiving, channel monitoring, frequency hopping (ONE register setting), auto calibrations as well as power saving mode. Then, MCU could easily use either polling or interrupt scheme by monitoring A7105's two general purpose I/O pins, GIO1 and GIO2 because of its digital interface.

**9. Control Register**

A7105 contains 51 x 8-bit control registers. MCU can access those control registers via 3-wire (SCS, SCK, SDIO) or 4-wire (SCS, SCK, SDIO, GIO1/GIO2) SPI interface (support max. SPI data rate up to 10 Mbps). User can refer to chapter 10 for details of SPI timing. A7105 is simply controlled by registers and outputs its status to MCU by GIO1 and GIO2 pins.

### 10. SPI

A7105 only supports one SPI interface with maximum data rate up to 10Mbps. MCU should assert SCS pin low (SPI chip select) to active accessing of A7105. Via SPI interface, user can access **control registers** and issue **Strobe command**. Figure 10.1 gives an overview of SPI access manners.

3-wire SPI (SCS, SCK and SDIO) or 4-wire SPI (SCS, SCK, SDIO and GIO1/GIO2) configuration is provided. For 3-wire SPI, SDIO pin is configured as bi-direction to be data input and output. For 4-wire SPI, SDIO pin is data input and GIO1 (or GIO2) pin is data output. In such case, GIO1S (0bh) or GIO2S (0ch) should be set to [0110].

For SPI write operation, SDIO pin is latched into A7105 at the rising edge of SCK. For SPI read operation, if input address is latched by A7105, data output is aligned at falling edge of SCK. Therefore, MCU can latch data output at the rising edge of SCK.

To control A7105's internal state machine, it is very easy to send Strobe command via SPI interface. The Strobe command is a unique command set with total 8 commands. See section 10.3, 10.4 and 10.5 for details.

	SPI chip select	Data In	Data Out
<b>3-Wire SPI</b>	SCS pin = 0	SDIO pin	SDIO pin
<b>4-Wire SPI</b>	SCS pin = 0	SDIO pin	GIO1 (GIO1S=0110) / GIO2 (GIO2S=0110)

Figure 10.1 SPI Access Manners

**10.1 SPI Format**

The first bit (A7) is critical to indicate A7105 the following instruction is “Strobe command” or “control register”. See Table 10.1 for SPI format. Based on Table 10.1, To access control registers, just set A7=0, then A6 bit is used to indicate read (A6=1) or write operation (A6=0). See Figure 10.2 (3-wire SPI) and Figure 10.3 (4-wire SPI) for details.

**10.2 SPI Timing Characteristic**

No matter 3-wire or 4-wire SPI interface is configured, the maximum SPI data rate is 10 Mbps. To active SPI interface, SCS pin must be set to low. For correct data latching, user has to take care hold time and setup time between SCK and SDIO. See Table 10.2 for SPI timing characteristic.

Parameter	Description	Min.	Max.	Unit
F <sub>C</sub>	FIFO clock frequency.		10	MHz
T <sub>SE</sub>	Enable setup time.	50		ns
T <sub>HE</sub>	Enable hold time.	50		ns
T <sub>SW</sub>	TX Data setup time.	50		ns
T <sub>HW</sub>	TX Data hold time.	50		ns
T <sub>DR</sub>	RX Data delay time.	0	50	ns

**10.3 SPI Timing Chart**

In this section, 3-wire and 4-wire SPI interface read / write timing are described.

**10.3.2 Timing Chart of 4-wire SPI**

**10.4 Strobe Commands**

A7105 supports 8 Strobe commands to control internal state machine for chip's operations. Table 10.3 is the summary of Strobe commands.

Be notice, Strobe command could be defined by 4-bits (A7~A4) or 8-bits (A7~A0). If 8-bits Strobe command is selected, A3 ~ A0 are don't care conditions. In such case, SCS pin can be remaining low for asserting next commands.

**10.5 Reset Command**

In addition to power on reset (POR), MCU could issue software reset to A7105 by setting Mode Register (00h) through SPI interface as shown below. As long as 8-bits address (A7~A0) are delivered zero and data (D7~D0) are delivered zero, A7105 is informed to generate internal signal “RESETN” to initial itself. After reset command, A7105 is in standby mode and calibration procedure shall be issued again.

**10.6 ID Accessing Command**

A7105 has built-in 32-bits ID Registers for customized identification code. It is accessed via SPI interface. ID length is recommended to be 32 bits by setting IDL (1Fh). Therefore, user can toggle SCS pin to high to terminate ID accessing command when ID data is output completely.

Figure 10.13 and 10.14 are timing charts of 32-bits ID accessing via 3-wire SPI.

**10.6.1 ID Write Command**

User can refer to Figure 10.2 for SPI write timing chart in details. Below is the procedure of ID write command.

- Step1: Deliver A7~A0 = 00000110 (A6=0 for write control register and issue ID addr = 06h).
- Step2: By SDIO pin, deliver 32-bits ID into A7105 in sequence by Data Byte 0, 1, 2 and 3.
- Step3: Toggle SCS pin to high when step2 is completed.

**10.7 FIFO Accessing Command**

To use A7105's FIFO mode, enable FMS (01h) =1 via SPI interface. Before TX delivery, just write wanted data into TX FIFO (05h) then issue TX Strobe command. Similarly, user can read RX FIFO (05h) once payload data is received.

MCU can use polling or interrupt scheme to do FIFO accessing. FIFO status can output to GIO1 (or GIO2) pin by setting GIO1S (0Bh) or GIO2S (0Ch).

Figure 10.15 and 10.16 are timing charts of FIFO accessing via 3-wire SPI.

**10.7.1 TX FIFO Write Command**

User can refer to Figure 10.2 for SPI write timing chart in details. Below is the procedure of TX FIFO write command.

- Step1: Deliver A7~A0 = 00000101 (A6=0 for write control register and issue FIFO A [5:0] = 05h).
- Step2: By SDIO pin, deliver (n+1) bytes TX data into TX FIFO in sequence by Data Byte 0, 1, 2 to n.
- Step3: Toggle SCS pin to high when step2 is completed.
- Step4: Send Strobe command of TX mode (Figure 10.9) to do TX delivery.

### 11. State machine

In chapter 9 and chapter 10, user can not only learn A7105's control registers but also know how to issue Strobe command. From section 10.2 ~ 10.6, it is clear to know configurations of 3-wire SPI and 4-wire SPI, Strobe command, software reset, and how to access ID Registers as well as TX/RX FIFO.

Section 11.1 introduces 7 states of built-in state machine. Combined with Strobe command and accessing control registers, section 11.2, 11.3 and 11.4 demonstrate 3 state diagrams to explain how transitions of A7105's operation.

From accessing data point of view, if FMS=1 (01h), FIFO mode is enabled, otherwise, A7105 is in direct mode. If FMS=1 and FIFO Read/Write in Standby mode, we call it is Normal FIFO mode. Otherwise, If FMS=1 and FIFO Read/Write in PLL mode, we called it is Quick FIFO mode due to the time reduction of PLL settling. If FMS=1 and FIFO Read/Write in IDLE mode, we called it is Power Saving FIFO mode due to the reduction of average current.

<b>3-Wire SPI</b>	SCS pin = 0	SDIO pin	SDIO pin	FIFO (FMS=1) Direct (FMS=0)	CKO pin (CKOS = 0001)

- (1) Normal FIFO Mode (FMS=1 and FIFO RW @ Standby mode)
- (2) Quick FIFO Mode (FMS=1 and FIFO RW @ PLL mode)
- (3) Power Saving FIFO Mode (FMS=1 and FIFO RW @ IDLE mode)
- (4) Quick Direct Mode (FMS=0 and FIFO ignored, write packet @ TX mode, read packet @ RX mode)

#### 11.1 Key states

A7105 supports 7 key operation states. Those are,

- (1) Standby mode
- (2) Sleep mode
- (3) Idle mode
- (4) PLL mode
- (5) TX mode
- (6) RX mode
- (7) CAL mode

After power on reset or software reset, A7105 is in standby mode. User has to do calibration process because all control registers are in initial values. The calibration process is very easy, user only needs to issue Strobe commands and enable calibration registers. Then, check the calibration flag because it is done automatic by internal state machine. Refer to 11.2, 11.3, 11.4 and chapter 15 for details. After calibration, A7105 is ready to do TX and RX operation.

**11.1.1 Standby mode**

If Standby Strobe command is issued, A7105 enters standby mode automatically. Internal power management is listed below. Be notice, A7105 is in standby mode once power on reset or software reset occurs.

**11.1.5 TX mode**

If TX Strobe command is issued, A7105 enters TX mode automatically for data delivery. Internal power management is listed below.

(1) In FIFO mode, once TX data packet (Preamble + ID + Payload) is delivered, A7105 supports auto-back function to previous state for next delivered packet.

(2) In Direct mode, once TX data packet is delivered, A7105 stays in TX mode. User has to issue Strobe command to back to previous state.

(1) In FIFO mode, once RX data packet (Preamble + ID + Payload) is received completely, A7105 supports auto-back function to previous state for next receiving packet.

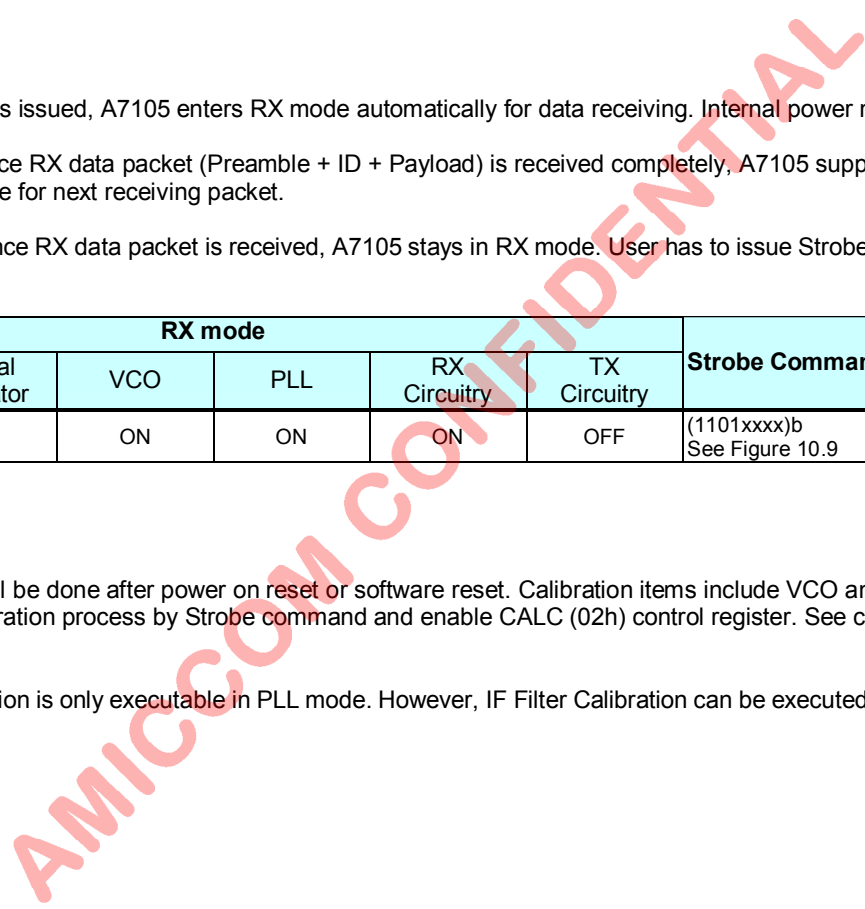

(2) In Direct mode, once RX data packet is received, A7105 stays in RX mode. User has to issue Strobe command to back to previous state.

RX mode						Strobe Command
On Chip Regulator	Crystal Oscillator	VCO	PLL	RX Circuitry	TX Circuitry	
ON	ON	ON	ON	ON	OFF	(1101xxxx)b See Figure 10.9

**11.1.7 CAL mode**

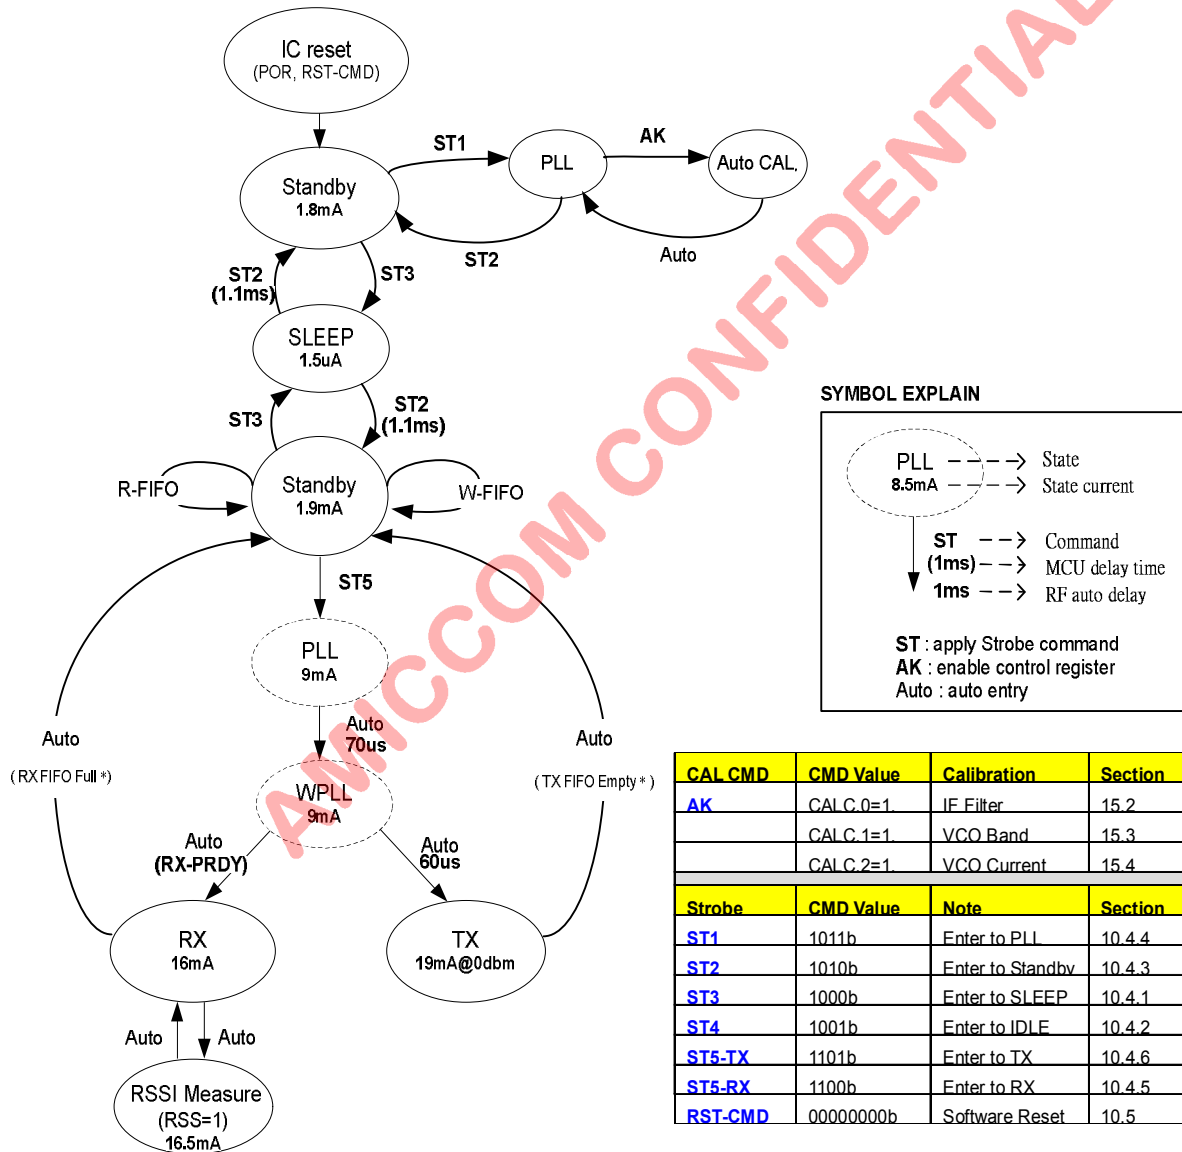

Calibration process shall be done after power on reset or software reset. Calibration items include VCO and IF Filter. It is easy to implement calibration process by Strobe command and enable CALC (02h) control register. See chapter 15 for details.

Be notice, VCO Calibration is only executable in PLL mode. However, IF Filter Calibration can be executed in Standby or PLL mode.

**11.2 Normal FIFO Mode**

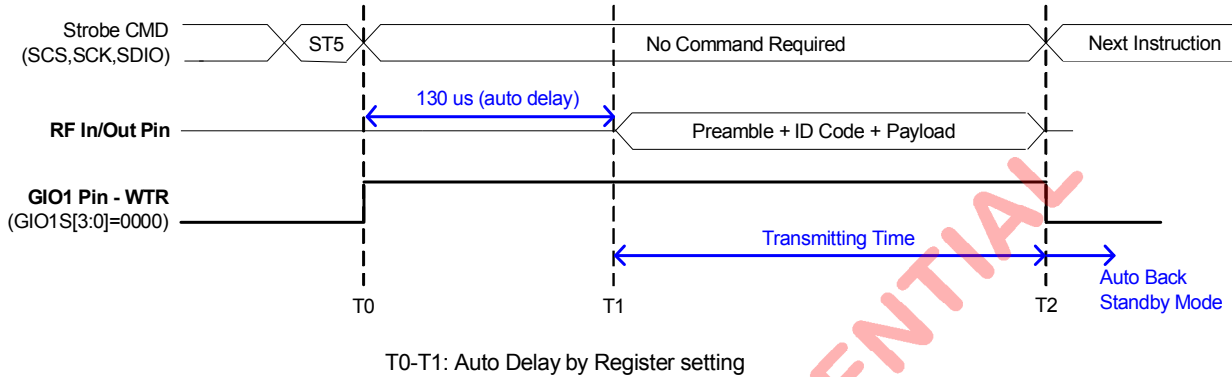

This mode is suitable for requirement of general purpose applications. After calibration flow, user can issue Strobe command to enter standby mode where write TX FIFO or read RX FIFO. From standby mode to packet transmission, only one Strobe command is needed. Once transmission is done, A7105 is auto back to standby mode. If all packets are finished and deeper power saving is necessary, user can issue Strobe command to ask A7105 staying in sleep mode. Figure 11.1 is the state diagram of Normal FIFO mode.

- Refer to chapter 16 for definition of RX FIFO Full and TX FIFO Empty.

### 11.5 Quick Direct Mode

This mode is suitable for fast transceiving. After calibration flow, for every state transition, user has to issue Strobe command to A7105. This mode is also suitable for the requirement of versatile packet format. Noted that user needs to take care the transition time by MCU's timer.

When packets are finished and deeper power saving is necessary, user can issue Strobe command to ask A7105 staying in idle mode (or sleep mode). Figure 11.3 is the state diagram of Quick Direct mode.

- Refer to chapter 16 for definition of RX FIFO Full and TX FIFO Empty.

Figure 11.10 State diagram of Quick Direct Mode

From Figure 11.10, After A7105 enters TX mode, MCU should immediately deliver preamble and defined packet to A7105's GIO1 or GIO2 pin. From Figure 11.10, Table 11.1, When ST5 command is issued for TX operation; see Figure 11.11 for detailed timing. A7105 status can be represented to GIO1 and GIO2 pin to MCU for timing control.

When ST5 command is issued for RX operation, from Figure 11.12, based on recovery clock (DCK), MCU has to decode received ID and payload from GIO1 pin (TRXD). GIO2 pin is either used to inform MCU for PMDO (Preamble Detect Output) or FSYNC (Frame Sync).

## 12 Crystal Oscillator

A7105 needs external crystal or external clock that is either 6 or 8/12/16/20/24 MHz to generate internal wanted clock. Be notice if external clock is lower than 8MHz, A7105 only supports data rate up to 250K.

**13. System Clock**

A7105 supports different external crystal frequency by programmable “Clock Register” (0Dh). Based on this, three important internal clocks  $F_{CGR}$ ,  $F_{DR}$  and  $F_{SYCK}$  are generated.

- (1)  $F_{XTAL}$ : Crystal frequency.
- (2)  $F_{XREF}$ : Crystal Ref. Clock =  $F_{XREF} * (DBL+1)$ .
- (3)  $F_{CGR}$ : Clock Generation Reference =  $2MHz = F_{XREF} / (GRC+1)$ , where  $F_{CGR}$  is used to generate 32M PLL.
- (4)  $F_{MCLK}$ : Master Clock is either  $F_{XREF}$ : or 32M PLL, where  $F_{MCLK}$  is used to generate  $F_{SYCK}$ .
- (5)  $F_{SYCK}$ : System Clock =  $16MHz = F_{MCLK} / CSC = 32 * F_{IF}$ , where  $F_{IF}$  is recommended to set 500KHz.
- (6)  $F_{DR}$ : Data Rate Clock =  $F_{IF} / (SDR+1)$ .
- (7)  $F_{PPD}$ : VCO Compared Clock =  $F_{XREF} / (RRC+1)$ .

**13.1 Bypass clock generation**

If crystal frequency is multiplier of 8MHz, the clock generator block can be turned off by setting CGS = 0. The relation between  $F_{XTAL}$  (crystal frequency) and data rate show below:

$$F_{XREF} = F_{XTAL} * (DBL+1)$$

$$F_{PPD} = F_{XREF} / (RRC [1:0]+1)$$

$$F_{DR} = F_{XREF} / (CSC [1:0]+1) / 32 / (SDR+1)$$

If crystal frequency is the multiplier of 2MHz and larger than 6MHz,  $F_{SYCK} = 32MHz$  by setting  $CGS = 1$  because the clock generation is 32MHz. The comparison frequency of clock generator  $F_{CGR}$  shall be 2MHz by setting  $GRC[3:0]$  to meets the below equations.

$$F_{CRG} = F_{XTAL} * (1+DBL) / (GRC+1) = 2MHz.$$

$$F_{DR} = F_{SYCK} / 32 / (SDR+1).$$

**14. Transceiver LO Frequency**

A7105 is a half-duplex transceiver with embedded PA and LNA. For TX or RX frequency setting, user just needs to set up LO (Local Oscillator) frequency for two ways radio transmission.

To target full range of 2.4GHz ISM band (2400 MHz to 2483.5 MHz), A7105 applies offset concept by LO frequency  $F_{LO} = F_{LO\_BASE} + F_{OFFSET}$ . Therefore, for 2.4GHz applications, A7105 is easy to implement frequency hopping and multi-channels by **ONE** register setting, **PLL Register I (CHN [7:0], 0Eh)**.

Below is the LO frequency block diagram.

### 14.1 LO Frequency Setting

From Figure 14.1,  $F_{LO}$  is not only for TX radio frequency but also to be RX LO frequency. To set up  $F_{LO}$ , it is easy to implement by below 7 steps.

- Set the base frequency ( $F_{LO\_BASE}$ ) by PLL Register II, III, IV and V (10h, 11h, 12h and 13h).  
**Recommend to set  $F_{LO\_BASE} \sim 2400.001\text{MHz}$ .**
- Set the channel step ( $F_{CHSP}$ ) by PLL Register II (0Fh).  
 **$F_{CHSP} = F_{XTAL} * (DBL+1) / 4 / (CHR+1)$ , Recommend  $F_{CHSP} = 500\text{ KHz}$ .**
- Set CHN [7:0] to get offset frequency by PLL Register I (0Fh).  
 **$F_{OFFSET} = CHN [7:0] * F_{CHSP}$**
- LO frequency is equal to base frequency plus offset frequency.  
 **$F_{LO} = F_{LO\_BASE} + F_{OFFSET}$**
- In TX mode, TX radio frequency ( $F_{TXRF}$ ) is equal to  $F_{LO}$ .  
 **$F_{TXRF} = F_{LO}$**

- Due to low-IF architecture, in RX mode, if  $ULS=0$ ,  $F_{RXLO} = F_{carrier} - F_{IF}$ , (Up side band).

- Due to low-IF architecture, in RX mode, if  $ULS=1$ ,  $F_{RXLO} = F_{carrier} + F_{IF}$ , (Low side band).

$F_{LO\_BASE}$

$$F_{LO\_BASE} = F_{PPFD} \cdot \left( BIP[8:0] + \frac{BFP[15:0]}{2^{16}} \right) = (DBL + 1) \cdot \frac{F_{XTAL}}{RRC[1:0] + 1} \cdot \left( BIP[8:0] + \frac{BFP[15:0]}{2^{16}} \right)$$

Base on the above formula, for example, if  $F_{XTAL} = 16$  MHz and set channel step  $F_{CHSP} = 500$  KHz, to get  $F_{LO\_BASE}$  and  $F_{LO}$ , see Table 14.1, 14.2, and Figure 14.2 for details.

## 14.2 IF Side Band Select

In two ways radio, both master and slave have two roles, TX and RX. In such case, A7105 offers two methods to set up  $F_{\text{LO}}$  while TRX exchanging.

- (1) Auto IF exchange
- (2) Fast exchange

### 14.2.1 Auto IF Exchange

A7105 supports Auto IF offset function (AIF, 01h). If AIF=1, user has no need to change CHN [7:0] for insert  $F_{IF}$  offset while TRX exchanging because  $F_{LO}$  is changed automatically. See Table 14.1 for details.

#### <Master>

AIF=1 and ULS=0,  $F_{RXLO}$  is auto shifted lower than  $F_{TXRF}$  for 500KHz ( $F_{IF}$ ).

#### <Slave>

AIF=1 and ULS=0,  $F_{RXLO}$  is auto shifted lower than  $F_{TXRF}$  for 500KHz ( $F_{IF}$ ).

If Data rate = 500Kbps

Item	Role	AIF	ULS	CHN[7:0]	$F_{CHSP}$ (KHz)	$F_{TXRF}$ (KHz)	$F_{RXLO}$ (MHz)	NOTE
<b>Master</b>	TX	1	0	10	500	2405.001	-	
	RX	1	0	10	500	-	2404.501	Up side band $F_{RXLO}$ is auto shifted
<b>Slave</b>	TX	1	0	10	500	2405.001	-	
	RX	1	0	10	500	-	2404.501	Up side band $F_{RXLO}$ is auto shifted
Role Exchanging		Above setting is the same to Master and Slave.						
Switching Time		Refer to Figure 11.4, If A7105 delivers one packet and receives one packet, $F_{LO}$ is changed from 2405.001 to 2404.501, longer switching time.  Total Switching time = TX ready time + RX ready time = ( 70 us + 60 us ) + ( 70 us + 60 us ) = <b>260 us</b>						
On air occupied frequency		Master $F_{TXRF}$ = 2405.001 MHz Slave $F_{TXRF}$ = 2405.001 MHz						<b>ONE</b> occupied frequency.

Table 14.4 AIF function while TRX exchanging

### 14.2.2 Fast Exchange

To reduce PLL settling time, user can disable AIF function and control ULS = 1 (Master side) and ULS = 0 (Slave side) for fast exchange in two-way radio. See Table 14.5 for details.

<Master>

AIF=0 and ULS=1, Master is set Low side band.

<Slave>

AIF=0 and ULS=0, Slave is set Up side band.

If Data rate = 500Kbps

Item	Role	AIF	ULS	CHN[7:0]	F <sub>CHSP</sub> (KHz)	F <sub>TXRF</sub> (KHz)	F <sub>RXLO</sub> (MHz)	NOTE
<b>Master</b>	TX	0	1	10	500	2405.001	-	
	RX	0	1	10	500	-	2405.001	Low side band
<b>Slave</b>	TX	0	0	9	500	2404.501	-	
	RX	0	0	9	500	-	2404.501	Up side band
Role Exchanging		ULS and CHN setting are different in Master and Slave site.						
Settling Time		Refer to Figure 11.4, If A7105 delivers one packet and receives one packet, Master's F <sub>LO</sub> is fixed at 2405.001MHz, shorter settling time.  Total Settling time = TX ready time + RX ready time = ( 10 us + 60 us ) + ( 10 us + 60 us ) = <b>140 us</b>						
On air occupied frequency		Master F <sub>TXRF</sub> = 2405.001 MHz Slave F <sub>TXRF</sub> = 2404.501 MHz						TWO occupied on-air frequency.

**14.3 Frequency Compensation**

Frequency Compensation function (FC) supports low accuracy crystal ( $\pm 20$  ppm) without sensitivity degradation. The FC concept is to fine tune RX LO frequency ( $F_{RXLO}$ ). MCU can read AC[14:0], (12h) and (13h), to executes frequency drift calculation and update new setting to PLL IV (12h) and PLL V (13h) to adjust the best RX LO frequency ( $F_{RXLO}$ ).

**16. FIFO (First In First Out)**

A7105 supports separated 64-bytes TX and RX FIFO by enabling FMS =1 (01h). For FIFO accessing, TX FIFO (write-only) and RX FIFO (read-only) share the same register address 05h. TX FIFO represents transmitted payload. On the other hand, once RX circuitry synchronizes ID Code, received payload is stored into RX FIFO.

In chapter 10 and 11, user can also find listed FIFO information below.

- (1) Figure 10.15 and 10.16 for FIFO accessing via 3-wire SPI.
- (2) Section 10.4.7 and 10.4.8 for FIFO pointer reset command.
- (3) Figure 11.2 and Figure 11.3 for Normal/Quick FIFO mode.

**16.1 Packet Format**

Figure 16.1 Packet Format of FIFO mode

Figure 16.2 ID Code Format

**Preamble:**

The packet is led by preamble composed of alternate 0 and 1. If the first bit of ID code is 0, preamble shall be 0101...0101. In the contrast, if the first bit of ID code is 1, preamble shall be 1010...1010. Preamble length is recommended to set 4 bytes by PML [1:0] (1Fh).

**ID code:**

ID code is recommended to set 4 bytes by IDL=1 (1Fh). ID Code is sequenced by Byte 0, 1, 2 and 3. If RX circuitry checks the ID code correct, received payload will be stored into RX FIFO. In special case, ID code could be set error tolerance (0~ 3bit error) by ETH [1:0] (20h) for ID synchronization check.

**Payload:**

Payload length is programmable by FEP [7:0] (03h). The physical FIFO depth is 64 bytes. A7105 also supports logical FIFO extension up to 256 bytes. See section 16.5 for details.

**CRC (option):**

In FIFO mode, if CRC is enabled (CRCS=1, 1Fh), 2-bytes of CRC value is transmitted automatically after payload. In the same way, RX circuitry will check CRC value and show the result to CRC Flag (00h).

- (3) Data Whitening by XOR PN7 (7-bits Pseudo Random Sequence).

#### CRC (Cyclic Redundancy Check):

- CRC is enabled by CRCS= 1 (1Fh). TX circuitry calculates the CRC value of payload (preamble, ID code excluded) and transmits 2-bytes CRC value after payload.
- RX circuitry checks CRC value and shows the result to CRC Flag (00h). If CRCF=0, received payload is correct, else error occurred. (CRCF is read only, it is revised internally while receiving every packet.)

#### FEC (Forward Error Correction):

- FEC is enabled by FECS= 1 (1Fh). Payload and CRC value (if CRCS=1) are encoded by (7, 4) Hamming code.
- Each 4-bits (nibble) of payload is encoded into 7-bits code word and delivered out automatically.  
(ex. 64 bytes payload will be encoded to 128 code words, each code word is 7 bits.)
- RX circuitry decodes received code words automatically. FEC supports 1-bit error correction each code word. Once 1-bit error occurred, FEC flag=1 (00h). (FECF is read only, it is revised internally while receiving every packet.)

#### Data Whitening:

- Data whitening is enabled by WHTS= 1 (1Fh). The initial seed of PN7 is WS [6:0] (22h). Payload is always encrypted by bit XOR operation with PN7. CRC and/or FEC are also encrypted if CRCS=1 and/or if FECS=1.

- RX circuitry decrypts received payload and 2-bytes CRC (if CRCS=1) automatically. Be notice, user shall set the same WS [6:0] (21h) to TX and RX.

In application points of view, A7105 supports 3 options of FIFO arrangement.

- (1) Easy FIFO
- (2) Segment FIFO
- (3) FIFO Extension

For FIFO operation, A7105 supports Strobe command to reset TX and RX FIFO pointer as shown below. User can refer to section 10.5 for FIFO write pointer reset and FIFO read pointer reset.

#### Strobe Command

#### 16.4.1 Easy FIFO

In Easy FIFO, max FIFO length is 64 bytes. FIFO length is equal to **(FEP [7:0] + 1)**. User just needs to control FEP [7:0] (03h) and disable PSA and FPM as shown below.

Register setting

TX	RX	Control Registers		
FIFO Length (byte)	FIFO Length (byte)	FEP[7:0] (03h)	PSA [5:0] (04h)	FPM [1:0] (04h)
1	1	0x00	0	0

32	32	0x1F	0	0
64	64	0x3F	0	0

Table 16.2 Control registers of Easy FIFO

**Procedures of TX FIFO Transmitting**

**16.4.2 Segment FIFO**

In Segment FIFO, TX FIFO length is equal to (FEP [7:0] – PSA [5:0] + 1). FPM [1:0] should be zero. This function is very useful for button applications. In such case, each button is used to transmit fixed code (data) every time. During initialization, each fixed code is written into corresponding segment FIFO once and for all. Then, if button is triggered, MCU just assigns corresponding segment FIFO (PSA [5:0] and FEP [7:0]) and issues TX strobe command.

If TX FIFO is arranged into 8 segments, each TX segment and RX FIFO length are 8 bytes

TX				Control Registers

**16.4.3 FIFO Extension**

In FIFO Extension, A7105 provide configurable FIFO threshold by setting FPM [1:0] in FIFO control register. FPM [1:0] is used to set FIFO Pointer Flag (FPF) to trigger MCU. FIFO pointer Flag (FPF) can be output to pin CKO by set CKOS = 2 (0AH). Refer Table 16.5 for FIFO Pointer Flag (FPF) threshold value.

In TX mode, when the result of WP (write pointer) subtracting RP (read pointer) is equal or less than the value set by FPM [1:0], FPF is 1. Otherwise it is 0.

In RX mode, when the result of WP (write pointer) subtracting RP (read pointer) is larger than the value set by FPM [1:0], FPF is 1. Otherwise it is 0.

DP is Delivering Pointer and WTX is TX-FIFO Write Pointer.

FPM [1:0]	Bytes in TX FIFO	Bytes in RX FIFO	FPF = 1 (CKO pin)	Note
[00]	4	60	WTX – DP <= 4	FPF=1, when delivering 60 <sup>th</sup> byte
[01]	8	56	WTX – DP <= 8	FPF=1, when delivering 56 <sup>th</sup> byte
[10]	12	52	WTX – DP <= 12	FPF=1, when delivering 52 <sup>th</sup> byte
[11]	16	48	WTX – DP <= 16	FPF=1, when delivering 48 <sup>th</sup> byte

RP is Receiving Pointer and RRX is RX-FIFO Read Pointer.

[00]	4	60	RP – RRX > 60	FPF=1, when receiving 60 <sup>th</sup> byte

[11]	16	48	RP – RRX > 16	FPF=1, when receiving 48 <sup>th</sup> byte

Table 16.4 FIFO point Flag threshold value.

A7105 could handle data package set up to 256 bytes by FEP [7:0] with different FPF trigger conditions. Be notice, setting of SPI data rate is important to prevent error operation of FIFO extension. The min. SPI data rate shall be equal or greater than **(A105 data rate + 500Kbps)**

**Procedures of TX FIFO Extension**

1. Initialize all control registers (refer A7105 reference code).
2. Set FEP [7:0] = 0xFF for 256-bytes FIFO extension.
3. Set FPM [1:0] = 11 for FPF trigger condition.

**17. ADC (Analog to Digital Converter)**

A7105 has built-in 8-bits ADC do RSSI measurement as well as carrier detection function. User can set FSARS (1Eh) to select 4MHz or 8MHz ADC clock (F<sub>ADC</sub>). The converting time is 8 x 20 x ADC clock periods. FSARS = 0 (F<sub>ADC</sub> =4MHz) is recommended to save power.

**17.1 RSSI Measurement**

A7105 has built-in 8-bits digital RSSI to detect RF signal strength. After measurement done, RSSI is stored in ADC [7:0] (1Dh). The more signal power, the smaller RSSI value.

Below is the measurement procedure:

**Auto RSSI measurement for TX Power:**

1. Set wanted F<sub>RxLO</sub> (Refer to chapter 14).
2. Set RSS= 1 (1Eh), FSARS= 0 (1Eh).
3. Set ARSSI= 1 (01h).
4. Send RX Strobe command.
5. Once entering into RX mode, A7105 executes 8-times average measurement repeatedly.
6. Once receiving packet and leaves RX mode, user can read digital RSSI value from ADC [7:0] (1Dh) for TX power.

Be notice, in step 6, if A7105 is set in direct mode, once the received packet is completed, MCU shall ask A7105 to leave RX mode within 40 us to prevent RSSI inaccuracy. The curve for RSSI vs. input power is negative slope. That means the smaller ADC value the larger input power.

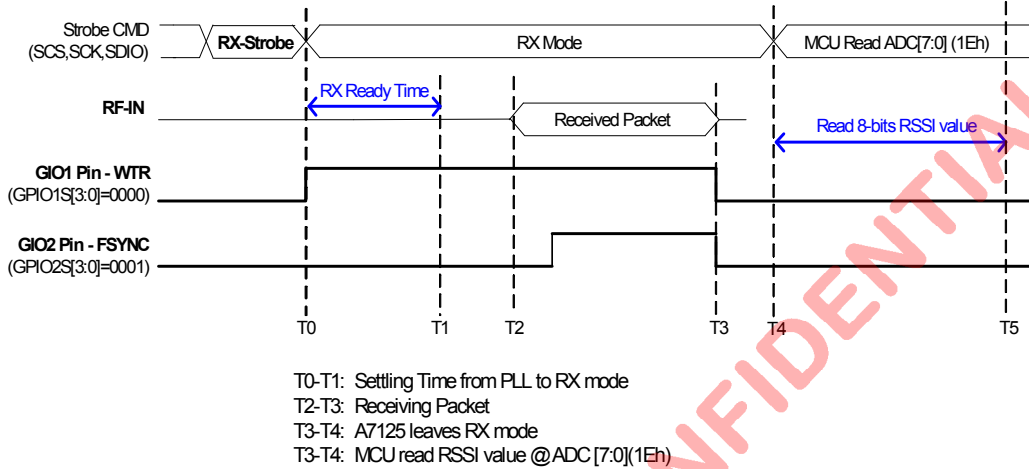

Figure 17.1 Timing chart of Auto RSSI measurement for TX Power:

**Auto RSSI measurement for Background Power:**

1. Set wanted  $F_{RXLO}$  (Refer to chapter 14).
2. Set RSS= 1 (1Eh), FSARS= 0 (1Eh).
3. Set ARSSI= 1 (01h).
4. Send RX Strobe command.
5. MCU delays min. 300us.
6. MCU disable ARSSI = 0 (01h).
7. Read digital RSSI value from ADC [7:0] (1Dh) to get background power.
8. Send Strobe command to ask A7105 to leave RX mode.

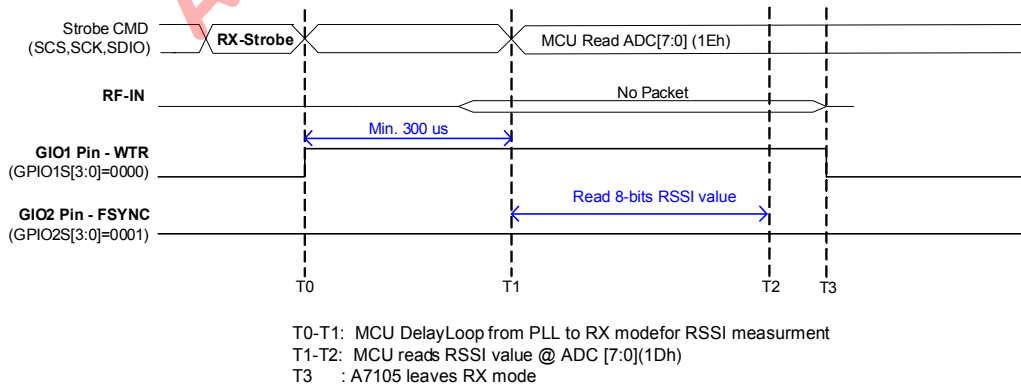

Figure 17.2 Timing chart of Auto RSSI measurement for Background Power:

**17.2 Carrier Detect**

Base on RSSI measurement, user can extend its application to do carrier detect (CD). If CD is triggered, it is output to GIO1 or GIO2 pin to inform MCU occupied channel.

Below is the detection procedure:

1. Set RTH (1Dh) for RSSI higher threshold by user's definition.
2. Recommend to set RSM = [11] (1Eh) to get RSSI lower threshold,  $RTL = RTH + RSM$ .
3. Set GIO1S = [0010] (0Bh) for GIO1 pin to output CD signal.
4.
  - (4-1) Set wanted  $F_{RXLO}$  (Refer to chapter 14).
  - (4-2) Set RSS= 1 (Enable RSSI, 1Eh), FSARS= 0 ( $F_{ADC} = 4MHz1Eh$ ).
  - (4-3) Set ARSSI= 1 (Enable Auto RSSI, 01h).
  - (4-4) RX Strobe command (In RX mode).
  - (4-5) MCU enables time out timer (min. 300 us).
5. MCU checks GIO1 pin for carrier detect (CD) signal until time out.
6. Leave RX mode.

Be notice,

In step 5, CD=1, this channel is occupied. ( $RSSI \leq RTH$ )  
 CD=0, this channel is clear. ( $RSSI \geq RTH$ )

**18. Battery Detect**

A7105 has built-in battery detector to check supply voltage (REGI pin). The detect range is 2.0V ~ 2.7V in 8 levels.

**Relative Control Register**

**[100]:** 2.4V. **[101]:** 2.5V. **[110]:** 2.6V. **[111]:** 2.7V.

Below is the procedure to detect low voltage input (ex. below 2.1V):

1. Set A7105 in standby or PLL mode.
2. Set BVT (27h) = [001] and enable BD\_E (27h) = 1.
3. After 5 us, BD\_E is auto clear.
4. MCU check BDF (27h).  
 If REGI pin > 2.1V,  
 BDF = 1. Else, BDF = 0.

**19 TX power setting**

For 0 dBm TX output power, the register setting: PAC = 2 and TBG = 7 are recommended.

For -10 dBm TX output power (low current requirement), PAC = 1 and TBG = 3 is recommended.
