All data is within limits
Horn Antenna and Broad-band Antennas were used and both polarizations of emissions were measured.

Quasi-peak measurements were performed if the maximised measurements were less than 6dB below the quasi-peak limit line.

Quasi-peak measurements are denoted by * in the table above

(2) Input Power Measurement

TEST REFERENCE : FCC Rules Part 18 Subpart C

TEST METHOD FCC / OST MP-5
TEST CONDITION: On mode (max. power)

TEST DATE : 2001-05-17

Test Method:

Input power was measured using a Wattmeter. A 1000ml water load was located at the center of the oven. The oven was operated at full output power.

Results:

Input Measurement			Manufacturer's Rating		
Voltage (Vac) Current (A) Input Power		Current Input Pow			
		(W)	(A)	(W)	
120	13.880	1586	15.0	1500	

TEST REPORT Date: 2000-05-21

(3) Output Power Measurement

TEST REFERENCE : FCC Rules Part 18 Subpart C

: FCC / OST MP-5 TEST METHOD TEST CONDITION : On mode (max. power)

TEST DATE : 2001-05-19

Test Method:

The output power was measured by the calorimetric method; using 1000ml load and evaluate the power output from the observed temperature rise of the load over a period of time.

The test method was based on clause 8 of IEC 705, Edition 3, Household Microwave Ovens – Methods for Measuring Performance.

Results:

Initial Temp (°C)	Final Temp (°C)	Observed Period (s)	Output Power (W)
10.0	22.3	50.0	1030.0

Remark:

Power (W) =
$$\frac{4.187(joules/cal)xVolume(ml)x\Delta T}{50}$$

Power (W) =
$$\frac{4.187 \times 1000 \times 12.3}{50}$$
 = 1030.0(W)

(4) Measurement of Output Frequency

TEST REFERENCE : FCC Rules Part 18 Subpart C

TEST METHOD : FCC / OST MP-5
TEST CONDITION : On mode (max. power)

TEST DATE : 2001-05-19

Test method:

The fundamental frequency was measured using a spectrum analyzer with precision frequency reference, with 1000ml load at the center of the oven.

Results:

Measured Frequency (MHz)	Manufacturer's Rated Frequency (MHz)		
2460	2450		

Remark:

Please see appendix D for graphical data.

No.: HM104422

(5) Output Frequency Stability

TEST REFERENCE : FCC Rules Part 18 Subpart C

TEST METHOD : FCC / OST MP-5
TEST CONDITION : On mode (max. power)

TEST DATE : 2001-05-19

Frequency variation with time:

Test method:

A spectrum analyzer was used to measure the frequency variation with time, with a 1000ml load located at the center of the oven with maximum power. The test was performed until the volume was reduced by evaporation to approximately 20% of the original quantity.

During the test, the spectrum analyzer trace was put on maximum hold in order to obtain a bandwidth plot showing the sideband edges.

Measurements were performed with the antenna in both horizontal and vertical polarities.

Results:

Load		Maximum sideband edge		Minimum sideband edge	
			(GHz)		Hz)
Initial Volume	Final Volume	Measured	Limit	Measured	Limit
(ml)	(ml)				
1000	200	2.463	2.500	2.454	2.400

Remark:

Please see appendix D for graphical data.

No.: HM104422

Frequency variation with line voltage:

Test Method:

A spectrum analyzer was used to measure the frequency variation for line voltage variation from 80% to 125% of normal voltage, with a 1000ml load located at the center of the oven with maximum power.

During the test, the spectrum analyzer trace was put on, maximum hold in order to obtain a bandwidth plot showing the sideband edges.

Measurements were performed with the antenna in both horizontal and vertical polarities.

Results:

Voltage	Maximum sideband edge		Voltage	Minimum sideband edge	
	Measured	Limit		Measured	Limit
(Vac)	(GHz)	(GHz)	(Vac)	(GHz)	(GHz)
150	2.476	2.500	150	2.442	2.400

Remark:

Please see appendix D for graphical data.
