7.2 Radiated Emission Test

The radiated emission measurement was performed according to the procedures in ANSI C63.10-2013. The equipment under test (EUT) was placed at the middle of the 80 cm high turntable for below 1 GHz & 1.5 m height for above 1 GHz measurement, and the EUT is 3 meters far from the measuring antenna. The turntable was rotated 360° for obtaining the maximum emission. The height of the measuring antennas was scanned between 1 m and 4 m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained. The measurement above 1000 MHz was performed by horn antenna, The measurement below 30 MHz was performed by loop antenna, Measurement from 30 MHz to 200 MHz was performed by Baloon and Biconical Antenna, and mesurement from 200 MHz to 1 GHz was performed by Log-Periodic Antenna.

The EUT was rotated around the X-, Y-, and Z-Axis and the results from worst case axis are recorded.
Field Strength (dB μ V/m) = Measured Value(dB μ V) + Antenna Factor(dB) + Cable Loss(dB) – Pre Amplifier Gain (dB)

Test Specification	FCC part 15 Subpart E 15.407 (a) / RSS 247 Issue 2, Section 6.2.1.1 & Section 6.2.4.1
Test Method	Subclause 12.3.2.4 of ANSI C63.10
Detector	Average sample detector
Port of testing	Antenna port
Requirement for FCC	For devices in the 5.15-5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW provided the maximum antenna gain does not exceed 6 dBi & for the 5.25-5.35 GHz and 5.47-5.725 GHz bands, the maximum conducted output power over the frequency bands of operation shall not exceed the lesser of 250 mW or 11 dBm + 10 log B
Requirement for IC	For devices in the 5.15-5.25 GHz band, the maximum e.i.r.p. shall not exceed 200 mW or 10 + 10 log10B, dBm, whichever power is less, for the frequency band 5.25-5.35GHz band, the maximum conducted output power shall not exceed 250 mW or 11 + 10 log10B, dBm, whichever is less, for the frequency band 5.5-5.58GHz and 5.66-5.7GHz, The maximum conducted output power shall not exceed 250 mW or 11 + 10 log10B, dBm, whichever is less.

Test Method

Measurements may be performed using a wideband RF power meter with a thermocouple detector or equivalent if all of the following conditions are satisfied:

1. The EUT is configured to transmit continuously or to transmit with a constant duty cycle.
2. At all times when the EUT is transmitting, it must be transmitting at its maximum power control level.
3. The integration period of the power meter exceeds the repetition period of the transmitted signal by at least a factor of five.
 - (ii) If the transmitter does not transmit continuously, measure the duty cycle, x, of the transmitter output signal as described in II.B.
 - (iii) Measure the average power of the transmitter. This measurement is an average over both the on and off periods of the transmitter.
 - (iv) Adjust the measurement in dBm by adding 10 log (1/x) where x is the duty cycle (e.g., 10 log (1/0.25) if the duty cycle is 25%).

Test Condition:

Normal Test Condition:

Temperature (Norm) = + 22.3 °C Voltage = 24V DC (through UAB Port) Relative humidity = 62 %

KDB Guidelines applied:

Measurements were made as per section 3 sub-section (a) in KDB 789033 D02 General UNII Test Procedures New Rules v02r01

Test results:

Note:

- All the losses are included during measurement and final values are mentioned in the test report
10 dB attenuator + 2.5 dB Cable loss = 12.5 dB total offset
- Duty cycle correction factor is considered in Final Average power
Duty cycle Correction factor = $10 \cdot \text{LOG} (1/X)$ Where X is Duty Cycle
- This product do not support additional beamforming gain / directional gain, it uses signal antenna and hence directional gain of the single antenna is 6.5 dBi
- e.i.r.p = Maximum Average output power (dBm) + Antenna gain in dBi (6.5 dBi)
- The transmitting antenna gain of the EUT is 6.5 dBi, which exceeds 6dBi antenna gain by 0.5 dB. Therefore the conducted output power limit is reduced by 0.5 as mentioned in the below table.
