1.7 TEST RESULTS

The requirements of this test document are fulfilled by the equipment under test. The complete test results are presented in the following.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 5 of 58

2 TECHNICAL DATA OF EQUIPMENT

2.1 DEVICE UNDER TEST

Type of equipment: *	Bluetooth module
Type designation: *	cB-0905-02-02
FCC ID: *	PVH090502L2
IC: *	5325A-090502L2
Antenna type: *	External
Antenna gain: *	Refer table below
Antenna connector: *	UFL connector
Power supply: *	3.0 V DC to 3.6 V DC
Type of modulation: *	FHSS (GFSK)
Operating frequency range:*	2.402 to 2.480 GHz
Number of channels: *	79
Temperature range: *	-30 °C to 85 °C

^{*:} declared by the applicant

Bluetooth operates in the unlicensed ISM band at 2.4 GHz. In North America (USA and Canada) a band with a width of 83.5 MHz is available. In this band 79 RF channels spaced 1 MHz apart are defined. The channel is represented by a pseudo random hopping sequence through the 79 channels. The normally occupancy time of one frequency will be 625 μ s. The ordinary hopping rate will be 1600 hops/s. All frequencies will be used equally.

Used antennas:

model name*	Antenna type	Rated Antenna gain*
m70cxr with RPSMA connector	external	+1.0 dBi

Used antenna combinations:

- m70cxr with RPSMA connector and integrated 3m cable
- m70cxr with RPSMA connector and 20cm cable + 3 m RPSMA/PPTNC extension cable
- m70cxr with RPSMA connector and 20cm cable + 5 m RPSMA/RPTNC extension cable
- m70cxr with RPSMA connector and 20cm cable + 7 m RPSMA/RPTNC extension cable

The following external I/O cables were used:

Cable	Length	Shielding	Connector
DC in	2 m *	No	6.3 mm jack plug

^{*:} Length during the test if no other specified.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 6 of 58

^{*:} declared by the applicant

2.2 PERIPHERY DEVICES

The following equipment was used as control unit and ancillary equipment:

- The Bluetooth module was connected to a carrier board (cB-0903-03), which was delivered by the applicant The carrier board was supplied via an external power supply with 5.0 V DC.
- A personal computer with a terminal-software was used, connected temporary to the carrier board, for setting the equipment into the necessary operation mode. During the measurement procedures the personal computer was disconnected

3 OPERATIONAL STATES AND PHYSICAL BOUNDARIES

The EUT is intended to be used in several bluetooth applications. Because the cB-0905-02 is a module, which will be implemented in a final application, it was mounted on a carrier board to change the operation modes of the EUT from a Laptop with test software. The tests were carried out with one unmodified sample with an antenna connector (sample marked with "24") and with an external antenna m70cxr.

During the tests the test sample was powered by an external power supply via the carrier board with 5.0 V DC.

If not otherwise stated, for modulating the transmitter, a pseudo random bit sequence with a length of 27 byte and with a pattern type DH5 was used.

For selecting an operation mode, a personal computer with a software delivered by the applicant was connected to the carrier board. After adjusting the operating mode, the personal computer was removed. To do this the test-engineer was instructed by the applicant.

During the tests, the EUT was not labelled with a FCC-label.

A radiated emission pre test (1 GHz up to 12 GHz) between the variants of antenna connection cables as described in chapter 2.1 of this document has shown that the antenna m70cxr with RPSMA connector and integrated 3m cable is the worst case constellation.

Due to this reasons all measurements was done with m70cxr with RPSMA connector and integrated 3m cable.

The following operation modes were used during the tests:

Operation mode	Description of the operation mode
1	Continuous transmitting on 2402 MHz
2	Continuous transmitting on 2441 MHz
3	Continuous transmitting on 2480 MHz
4	Transmitter hopping on all channels
5	Continuous receiving on 2441 MHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 7 of 58

4 ADDITIONAL INFORMATION

The cB-0905-02-02 is the same module as cB-0905-02 (FCC ID PVH090502L) apart from the below listed changes. The cB-0905-02 was already tested under PHOENIX-TESTLAB test report reference R61184_A Edition 1. The reason for this report is to show the compliance of the module with the listed changes.

Change between cB-0905-02-02 and cB-0905-02 module:

- Limited power setting: 0xFC (cB-0905-02 module: 0xFF)
- Component L6 changed to an Film Chip Coil (inductor) with the value 3.9nH (L6 is not mounted in cB-0905-02 module)
- Used Antenna m70cxr with different connection cables as described in chapter 2.1 of this document.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 8 of 58

6.2 CARRIER FREQUENCY SEPARATION

6.2.1 METHOD OF MEASUREMENT (CARRIER FREQUENCY SEPARATION)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings shall be used:

- Span: Wide enough to capture the peaks of two adjacent channels.
- Resolution bandwidth: ≥ 1 % of the span.
- Video bandwidth: ≥ the resolution bandwidth.
- Sweep: Auto.
- Detector function: peak.
- Trace mode: Max hold.

After trace stabilisation the marker and the delta marker function will be used to determine the separation between the peaks of two adjacent channel signals.

The measurement will be performed at the upper, the lower end and the middle of the assigned frequency band.

Test set-up:

EUT	Spectrum analyser

6.3 NUMBER OF HOPPING FREQUENCIES

6.3.1 METHOD OF MEASUREMENT (NUMBER OF HOPPING FREQUENCIES)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings shall be used:

- Span: Equal to the assigned frequency band.
- Resolution bandwidth: ≥ 1 % of the span.
- Video bandwidth: ≥ the resolution bandwidth.
- Sweep: Auto.
- Detector function: Peak.
- Trace mode: Max hold.

After trace stabilisation the number of hopping channels could be counted. It might be possible to divide the span into some sub ranges in order to clearly show all hopping frequencies.

Test set-up:

EUT	Spectrum analyser

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 15 of 58

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 16 of 58

6.4 DWELL TIME

6.4.1 METHOD OF MEASUREMENT (DWELL TIME)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings shall be used:

- Span: Zero, centred on a hopping channel.
- Resolution bandwidth: 1 MHz.
- Video bandwidth: ≥ the resolution bandwidth.
- Sweep: As necessary to capture the entire dwell time per hopping channel.
- Detector function: peak.
- Trace mode: Max hold.

The marker and delta marker function of the spectrum analyser will be used to determine the dwell time.

The measurement will be performed at the upper and lower end and the middle of the assigned frequency band.

If the EUT is possible to operate with different mode of operation (data rates, modulation formats etc.) the test will be repeated with every different operation mode of the EUT.

Test set-up:

EUT	Spectrum analyser

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 17 of 58

6.4.2 TEST RESULTS (DWELL TIME)

Ambient temperature	20 °C	Relative humidity	46 %
---------------------	-------	-------------------	------

72194_115.wmf: (Dwell time at the lower end of the assigned frequency band), hopping mode DH5:

72194_116.wmf: Dwell time at the middle of the assigned frequency band), hopping mode DH5:

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 18 of 58

72194 117.wmf: (Dwell time at the upper end of the assigned frequency band), hopping mode DH5:

The dwell time is calculated with the following formula:

Dwell time = $t_{pulse} x n_{hops} / number of channels x 31.6 s$

Where:

 t_{pulse} is the measured pulse time (pls. refer the plots of the spectrum analyser above) [s], n_{hops} is the number of hops per second in the actual operating mode of the transmitter [1/s].

The hopping rate of the system is 1600 hops per second and the system uses 79 channels. For this reason one time slot has a length of $625 \mu s$.

With the used hopping mode (DH5) a packet need 5 timeslots for transmitting and the next timeslot for receiving. So the system makes in worst case 266.67 hops per second in transmit mode (n_{hops} = 266.667 1/s)

Channel number	Channel frequency [MHz]	t _{pulse}	Dwell time [ms]
0	2402	2.976 ms	317.440
39	2441	2.976 ms	317.440
78	2480	2.978 ms	317.653

Limit: The dwell time of the channel shall be less than 0.4 s in a 31.6 s period

Test: Passed

TEST EQUIPMENT USED FOR THE TEST:

, 46, 54

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 19 of 58

6.5 MAXIMUM PEAK OUTPUT POWER

6.5.1 METHOD OF MEASUREMENT (MAXIMUM PEAK OUTPUT POWER)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be disenabled.

The following spectrum analyser settings shall be used:

- Span: Approx. 5 times the 20 dB bandwidth, centred on a hopping channel.
- Resolution bandwidth: > the 20 dB bandwidth of the emission being measured.
- Video bandwidth: ≥ the resolution bandwidth.
- Sweep: Auto.
- Detector function: peak.
- Trace mode: Max hold.

After trace stabilisation the marker shall be set on the signal peak. The indicated level is the peak output power, which has to be corrected with the value of the cable loss and an external attenuation (if necessary).

The measurement will be performed at the upper and lower end and the middle of the assigned frequency band.

Test set-up:

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 20 of 58

6.5.2 TEST RESULTS (MAXIMUM PEAK OUTPUT POWER)

Ambient temperature	20 °C		Relative humidity	30 %
---------------------	-------	--	-------------------	------

72194_72.wmf (maximum peak output power at the lower end of the assigned frequency band):

6.6 CONDUCTED EMISSIONS (TRANSMITTER)

6.6.1 METHOD OF MEASUREMENT (CONDUCTED EMISSIONS)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be disenabled.

The following spectrum analyser settings shall be used:

In the frequency range from 9 kHz to 1 MHz:

- Start frequency: 9 kHz.Stop frequency: 1 MHz.
- Resolution bandwidth: 200 Hz.
- Video bandwidth: 200 Hz.
- Sweep: Auto.
- Detector function: Peak.
- Trace mode: Max hold.

In the frequency range from 1 MHz to 25 GHz:

- Start frequency: 1 MHz.
- Stop frequency: 25 GHz.
- Resolution bandwidth: 100 kHz.
- Video bandwidth: 100 kHz.
- Sweep: Auto.
- Detector function: Peak.
- Trace mode: Max hold.

After trace stabilisation the marker shall be set on the signal peak. The first display line has to be set 20 dB below the peak marker. Every emission has to be below the display line.

The measurement will be performed with the EUT operates at the middle, the upper and lower end of the assigned frequency band and with hopping off.

Test set-up:

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 23 of 58

6.7 BAND-EDGE COMPLIANCE

6.7.1 METHOD OF MEASUREMENT (BAND-EDGE COMPLIANCE (RADIATED))

The same test set-up as used for the final radiated emission measurement shall be used (refer also subclause 5.8.1 of this test report). The measurements shall be carried out with using a resolution bandwidth of 100 kHz.

The following spectrum analyser settings shall be used:

- Span: Wide enough to capture the peak level of the emission on the channel closest to the band-edge, as well as any modulation products, which fall outside the assigned frequency band.
- Resolution bandwidth: 100 kHz.
- Video bandwidth: ≥ the resolution bandwidth.
- Sweep: Auto.
- Detector function: Peak.Trace mode: Max hold.

After trace stabilisation the marker shall be set on the signal peak. The first display line has to be set on this value. The second display line has to be set 20 dB below the first line (or the peak marker). The frequency line shall be set on the edge of the assigned frequency band. Set the second marker on the emission at the band-edge, or on the highest modulation product outside of the band, if this level is higher than that at the band-edge. This frequency shall be measured with the EMI receiver as described in subclause 5.8.1 of this test report, but 100 kHz resolution bandwidth shall be used.

The measurement will be performed at the upper end of the assigned frequency band and with hopping on and off.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 28 of 58

6.7.2 TEST RESULT (BAND-EDGE COMPLIANCE)

Ambient temperature	20 °C		Relative humidity	30 %

72194eg3.wmf (radiated band-edge compliance, upper band edge, hopping off):

72194eg3.wmf (radiated band-edge compliance, upper band edge, hopping on):

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 30 of 58

The plots on the page before are showing the radiated band-edge compliance for the upper band-edge, with and without hopping. The display line 1 (D1) in these plots represents the highest level within the assigned frequency band. The display line 2 (D2) represents the 20 dB offset to this highest level and shows the compliance with FCC 47 CFR Part 15.247 (d). The frequency line 1 (F1) shows the edge of the assigned frequency.

Test: Passed

TEST EQUIPMENT USED FOR THE TEST:

29, 31 - 37, 39, 43, 46, 49 - 51, 54

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 32 of 58

6.8 RADIATED EMISSIONS

6.8.1 METHOD OF MEASUREMENT (RADIATED EMISSIONS)

The radiated emission measurement is subdivided into five stages.

- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 9 kHz to 1 GHz.
- A final measurement carried out on an outdoor test side without reflecting ground plane and a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A final measurement carried out on an open area test side with reflecting ground plane and various antenna height in the frequency range 30 MHz to 1 GHz.
- A preliminary measurement carried out in a fully anechoic chamber with a variable antenna distance and height in the frequency range 1 GHz to 25 GHz.
- A final measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 1 GHz to 25 GHz.

All measurements will be carried out with the EUT working on the middle and upper and lower edge of the assigned frequency band. For this reason the hopping function of the EUT has to be disenabled.

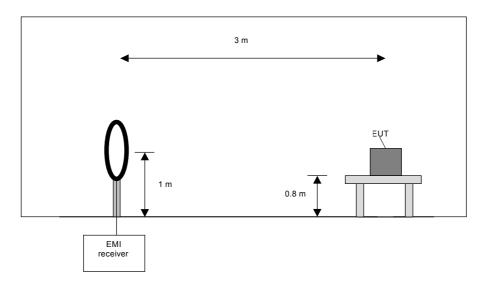

Preliminary measurement (9 kHz to 30 MHz):

In the first stage a preliminary measurement will be performed in a shielded room with a measuring distance of 3 meters. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2003 [1].

The frequency range 9 kHz to 30 MHz will be monitored with a spectrum analyser while the system and its cables will be manipulated to find out the configuration with the maximum emission levels if applicable. The EMI Receiver will be set to MAX Hold mode. The EUT and the measuring antenna will be rotated around their vertical axis to found the maximum emissions.

The resolution bandwidth of the spectrum analyser will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	10 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 33 of 58

Preliminary measurement procedure:

Prescans were performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.

The following procedure will be used:

- 1) Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
- 2) Manipulate the system cables within the range to produce the maximum level of emission.
- 3) Rotate the EUT by 360 ° to maximize the detected signals.
- 4) Make a hardcopy of the spectrum.
- 5) Measure the frequencies of highest detected emission with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
- 6) Repeat steps 1) to 5) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
- 7) Rotate the measuring antenna and repeat steps 1) to 5).

Final measurement (9 kHz to 30 MHz):

In the second stage a final measurement will be performed on an open area test site with no conducting ground plane in a measuring distances of 3 m, 10 m and 30 m. In the case where larger measuring distances are required the results will be extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with a EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an average detector will be used according Section 15.209 (d) [2].

On the during the preliminary measurement detected frequencies the final measurement will be performed while rotating the EUT and the measuring antenna in the range of 0 $^{\circ}$ to 360 $^{\circ}$ around their vertical axis until the maximum value is found.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 34 of 58

Final measurement procedure:

The following procedure will be used:

- 1) Monitor the frequency range with the measuring antenna at vertical orientation parallel to the EUT at an azimuth of 0 °.
- 2) Rotate the EUT by 360 ° to maximize the detected signals and note the azimuth and orientation.
- 3) Rotate the measuring antenna to find the maximum and note the value.
- 4) Rotate the measuring antenna and repeat steps 1) to 3) until the maximum value is found.
- 5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).

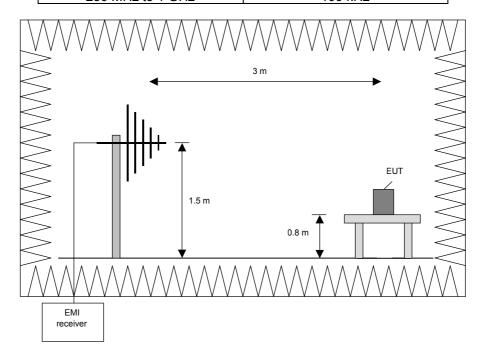

Preliminary measurement (30 MHz to 1 GHz)

In the first stage a preliminary measurement will be performed in a fully anechoic chamber with a measuring distance of 3 meter. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2003 [1].

The frequency range 30 MHz to 1 GHz will be measured with an EMI Receiver set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 230 MHz	100 kHz
230 MHz to 1 GHz	100 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 35 of 58

Procedure preliminary measurement:

Prescans were performed in the frequency range 30 MHz to 230 MHz and 230 MHz to 1 GHz. The following procedure will be used:

- 1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
- 2. Manipulate the system cables within the range to produce the maximum level of emission.
- 3. Rotate the EUT by 360 ° to maximize the detected signals.
- 4. Make a hardcopy of the spectrum.
- 5. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
- 6. Repeat 1) to 4) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
- 7. Repeat 1) to 5) with the vertical polarisation of the measuring antenna.

Final measurement (30 MHz to 1 GHz)

A final measurement on an open area test site will be performed on selected frequencies found in the preliminary measurement. During this test the EUT will be rotated in the range of

0 ° to 360 °, the measuring antenna will be set to horizontal and vertical polarisation and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Resolution bandwidth
120 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 36 of 58

Procedure final measurement:

The following procedure will be used:

- 1) Measure on the selected frequencies at an antenna height of 1 m and a EUT azimuth of 23 °.
- 2) Move the antenna from 1 m to 4 m and note the maximum value at each frequency.
- 3) Rotate the EUT by 45 ° and repeat 2) until an azimuth of 337 ° is reached.
- 4) Repeat 1) to 3) for the other orthogonal antenna polarization.
- 5) Move the antenna and the turntable to the position where the maximum value is detected.
- 6) Measure while moving the antenna slowly +/- 1 m.
- 7) Set the antenna to the position where the maximum value is found.
- 8) Measure while moving the turntable +/- 45 °.
- 9) Set the turntable to the azimuth where the maximum value is found.
- 10) Measure with Final detector (QP and AV) and note the value.
- 11) Repeat 5) to 10) for each frequency.
- 12) Repeat 1) to 11) for each orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).

Preliminary and final measurement (1 GHz to 25 GHz)

This measurement will be performed in a fully anechoic chamber. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2003 [1].

Preliminary measurement (1 GHz to 25 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The spectrum analyser set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna, the antenna close to the EUT and while moving the antenna over all sides of the EUT. With the spectrum analyser in CLEAR / WRITE mode the cone of the emission should be found and than the measuring distance will be set to 3 m with the receiving antenna moving in this cone of emission. At this position the final measurement will be carried out.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	100 kHz
4 GHz to 12 GHz	100 kHz
12 GHz to 18 GHz	100 kHz
18 GHz to 25 GHz	100 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 37 of 58

Final measurement (1 GHz to 25 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The EMI Receiver set to peak and average mode and a resolution bandwidth of 1 MHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 ° in order to have the antenna inside the cone of radiation.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 25 GHz	1 MHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 38 of 58

Procedure of measurement:

The measurements were performed in the frequency range 1 GHz to 4 GHz, 4 GHz to 12 GHz, 12 GHz to 18 GHz and 18 GHz to 25 GHz.

The following procedure will be used:

- 1) Monitor the frequency range at horizontal polarisation and move the antenna over all sides of the EUT (if necessary move the EUT to another orthogonal axis).
- 2) Change the antenna polarisation and repeat 1) with vertical polarisation.
- 3) Make a hardcopy of the spectrum.
- 4) Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
- 5) Change the analyser mode to Clear / Write and found the cone of emission.
- 6) Rotate and move the EUT, so that the measuring distance can be enlarged to 3 m and the antenna will be still inside the cone of emission.
- 7) Measure the level of the detected frequency with the correct resolution bandwidth, with the antenna polarisation and azimuth and the peak and average detector, which causes the maximum emission.
- 8) Repeat steps 1) to 7) for the next antenna spot if the EUT is larger than the antenna beamwidth.

Step 1) to 6) are defined as preliminary measurement.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 39 of 58

6.8.2 TEST RESULTS (RADIATED EMISSIONS)

6.8.2.1 PRELIMINARY MEASUREMENT (9 kHz to 25 GHz)

Ambient temperature	21 °C	Relative humidity	38 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table of a height of 0.8 m. The distance

between EUT and antenna was 3 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of

the cable guide refer to the pictures in annex A of this test report.

Test record: Where not otherwise stated the test was carried out in test mode 2 of the EUT, because

there was no difference to the other test modes. All results are shown in the following.

Supply voltage: During all measurements the EUT was supplied with 5.0 V DC via the carrier board.

72194 62.wmf: Spurious emissions, from 9 kHz to 150 kHz:

TEST EQUIPMENT USED FOR THE TEST:

29, 31 - 37, 39, 43, 46, 49 - 51, 54

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 40 of 58

72194_61.wmf: Spurious emissions, from 150 kHz to 1 MHz

72194 60.wmf: Spurious emissions, from 1 MHz to 30 MHz

No significant frequencies above the noise floor of the system were found during the preliminary radiated emission test, so no measurements were carried out on the outdoor test site.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 41 of 58

72194_52.wmf: Spurious emissions, from 30 MHz to 230 MHz

72194 51.wmf: Spurious emissions, from 230 MHz to 1 GHz

The following frequencies were found during the preliminary radiated emission test:

- 176.946 MHz, 235.928 MHz, 294.910 MHz, 353.892 MHz, 412.876 MHz and 471.855 MHz.

The following frequency was found inside the restricted bands:

- none.

These frequencies have to be measured on the open area test site. The results were presented in the following

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 42 of 58

<u>Transmitter operates at the lower end of the assigned frequency band (operation mode 1)</u>

72194_27.wmf (1 GHz to 4 GHz):

72194_30.wmf (4 GHz to 12 GHz):

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 43 of 58

72194_34.wmf (12 GHz to 18 GHz):

72194 33.wmf (18 GHz to 25 GHz):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 4.804 GHz, 12.010 GHz

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 2.402 GHz, 7.206 GHz, 9.608 GHz, 14.412 GHz, 16.812 GHz.

These frequencies have to be measured in a final measurement. The results were presented in the following.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 44 of 58

<u>Transmitter operates at the middle of the assigned frequency band (operation mode 2)</u>

72194_31.wmf (4 GHz to 12 GHz):

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 45 of 58

72194_31.wmf (12 GHz to 18 GHz):

72194 32.wmf (18 GHz to 25 GHz):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 4.882 GHz, 7.323 GHz and 12.205 GHz

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 2.441 GHz, 9.764 GHz and 17.087 GHz

These frequencies have to be measured in a final measurement. The results were presented in the following.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 46 of 58

Transmitter operates at the upper end of the assigned frequency band (operation mode 3)

72194_28.wmf (1 GHz to 4 GHz):

72194_32.wmf (4 GHz to 12 GHz):

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 47 of 58

72194_35.wmf (12 GHz to 18 GHz):

72194 36.wmf (18 GHz to 25 GHz):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 4.960 GHz and 7440 GHz

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 2.480 GHz, 9.920 GHz, 14.880 GHz and 17.360 GHz

These frequencies have to be measured in a final measurement. The results were presented in the following.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 48 of 58

6.8.2.2 FINAL MEASUREMENT (30 MHz to 1 GHz)

Ambient temperature	21 °C	Relative humidity	38 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table of a height of 0.8 m. The distance

between EUT and antenna was 3 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of

the cable guide refer to the pictures in annex A of this test report.

Supply voltage: During all measurements the EUT was supplied with 5.0 V DC via the carrier board.

Test record: The test was carried out in test mode 2 of the EUT, because there was no difference to

the other test modes.

Resolution bandwidth: For all measurements a resolution bandwidth of 120 kHz was used.

Test results: The test results were calculated with the following formula:

Result $[dB\mu V/m]$ = reading $[dB\mu V]$ + cable loss [dB] + antenna factor [dB/m]

The measured points and the limit line in the following diagram refer to the standard measurement of the emitted interference in compliance with the above mentioned standard. The measured points marked with x are the measured results of the standard subsequent measurement on the open area test site.

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 49 of 58

The results of the standard subsequent measurement on the open area test site are indicated in the table below. The limits as well as the measured results (levels) refer to the above mentioned standard while taking account of the specified requirements for a 3 m measuring distance.

Result measured with the quasipeak detector:

Test: Passed

TEST EQUIPMENT USED FOR THE TEST:

29, 31 - 37, 39, 43, 46, 49 - 51, 54

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 53 of 58

6.9 CONDUCTED EMISSIONS ON POWER SUPPLY LINES (150 kHz to 30 MHz)

6.9.1 METHOD OF MEASUREMENT

This test will be carried out in a shielded chamber. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm above the ground plane. Floor-standing devices will be placed directly on the ground plane. The set up of the Equipment under test will be in accordance to ANSI C63.4-2003 [1].

The frequency range 150 kHz to 30 MHz will be measured with an EMI Receiver set to MAX Hold mode with peak and average detector and a resolution bandwidth of 9 kHz. A scan will be carried out on the phase (or plus pole in case of DC powered devices) of the AC mains network. If levels detected 10 dB below the appropriable limit, this emission will be measured with the average and quasi-peak detector on all lines.

Frequency range	Resolution bandwidth
150 kHz to 30 MHz	9 kHz

Examiner: Dieter SUETTHOFF Date of issue: 18 March 2008 Page 54 of 58

6.9.2 TEST RESULTS (CONDUCTED EMISSIONS ON POWER SUPPLY LINES)

Ambient temperature	21 °C	Relative humidity	39 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table of a height of 0.8 m.

Cable guide: The cable of the EUT was fixed on the non-conducting table. For further information of

the cable guide refer to the pictures in annex A of this test report.

Test record: All results are shown in the following.

Title: AC Powerline Conducted Emission Test with

protective ground conductor simulating network

EUT: Bluetoot module CB0905-02-02

Manufacturer: connectBlue

Operating Condition: 120 V / 60 Hz, With AC / DC adapter mascot type 2121

Test site: PHOENIX TESTLAB Blomberg M4

Operator: D. Suetthoff

Test Specification: With m70cxr antenna Comment: Power setting FC

The curves in the diagram only represent for each frequency point the maximum measured value of all preliminary measurements which were made for each power supply line. The top measured curve represents the peak measurement and the bottom measured curve the average measurement. The quasi-peak measured points are marked by x and the average measured points by +.
