

FCC ID: PWO460007

CT Project: P13a0013

From: Daniel Park

Date: 2/5/14

1. The Operational Description still says “inside a vehicle or building”. Stating Building implies a larger operating area. There does not seem to be any description of Coupling the signal from Cell Phone to Cradle. There is a clear description of the Radiation of the signal from Cradle to Handset. Unless the coupling is performed by a wired connection, the Radiated testing for the DL band from cradle to handset will still need to be performed. Please provide clarification how we take this booster as coupling device. Please provide further detail information to prove or support as stated originally. Otherwise, provide RF exposure report for simultaneous transmission data like the MPE report from “PWO460013” application.

Wilson: The information for the inside antenna specifications is included in the MPE and the MSCL that was originally submitted with the booster.
