Compliance Testing, LLC, has been accredited in accordance with the recognized International Standard ISO/IEC 17025:2005. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to the joint ISO-ILAC-IAF Communiqué dated January 2009).

The tests results contained within this test report all fall within our scope of accreditation, unless noted below.

Please refer to http://www.compliancetesting.com/labscope.html for current scope of accreditation.

Testing Certificate Number: **2152.01**

FCC Site Reg. #349717

IC Site Reg. #2044A-2

Test and Measurement Data
Sub-part
2.1033(c)(14):
All tests and measurement data shown were performed in accordance with FCC Rules and Regulations, Part 2,
Subpart J and the following individual Parts: 20.21 in conjunction with latest version of KDB 935210.

Standard Test Conditions and Engineering Practices
Except as noted herein, the following conditions and procedures were observed during the testing:
In accordance with ANSI/C63.4-2014, and unless otherwise indicated in the specific measurement results, the ambient
temperature of the actual EUT was maintained within the range of 10° to 40°C (50° to 104°F), unless the particular
equipment requirements specified testing over a different temperature range. Also, unless otherwise indicated, the
humidity levels were in the range of 10% to 90% relative humidity.

Environmental Conditions		
Temp (ºC)	Humidity (%)	Pressure (mbar)
19.7 – 21.8	29.0 – 42.5	960.4 – 973.8

Measurement results, unless otherwise noted, are worst-case measurements.

EUT Description
Model: 460055
Description: Quint Band Mobile Signal Booster
Firmware: A560055A
Software: A560055
Serial Number: 2
Additional Information:

The EUT is a mobile bi-directional amplifier for the boosting of cellular phone signals and data communication devices.
The following frequency bands and emission types are utilized.

**This mobile booster is the identical as mobile booster FCC ID PWO560054 with the only difference being lower
output power for the uplink band.**

**New test data was recorded for authorized frequency band, uplink output power, gain, variable gain,
intermodulation, and noise power. The remaining test data from FCC ID PWO560054 was used in this test report**.

Frequency Band (MHz)					
Uplink	698 - 716	776 – 787 (IC, 777 – 787)	824 - 849	1850 - 1915	1710 – 1755
Downlink	728 - 746	746 – 757 (IC, 746 – 756)	869 - 894	1930 - 1995	2110 - 2155
Modulation Type	LTE		GSM, CDMA, EDGE, HSPA. EVDO, LTE		CDMA, HSPA, LTE, EDGE, EVDO

Emission Designators					
CDMA	**HSPA**	**LTE**	**EVDO**	**EDGE**	**GSM**
F9W	F9W	G7D	F9W	G7W	GXW

The modulation types and emission designators listed in the tables represent the modulations that the cell phone
providers use for each frequency band. GSM, CDMA, and WCDMA represent all the modulation types (phase and
amplitude or a combination thereof) utilized within the industry. EDGE, HSPA, LTE etc. are all protocols or multiplexing
techniques using the base modulations.

EUT Operation during Tests
The EUT was in a normal operating condition with all external attenuation set to 0 dB.
The EUT is powered by 5 vdc.

Test Result Summary

Specification	Test Name	Pass, Fail, N/A	Comments

Notes:
This mobile booster is the identical as mobile booster FCC ID PWO460054 with the only difference being lower output power for the uplink band.

New test data was recorded for uplink authorized frequency band, uplink output power, gain, uplink intermodulation, and uplink noise power.

The remaining test data from FCC ID PWO560054 was used in this test report.

Engineer: Greg Corbin
Test Date: 12/19/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor as needed to ensure accurate readings. A signal generator was utilized to produce a CW input signal tuned to the center channel of the operational band. The RF input level was increased to a point just prior to the AGC being in control of the power. The Signal generator was set to sweep across 2X the operational band of the EUT while the spectrum analyzer was set to MAX HOLD. Two markers were placed at the edges of the operational band and a third marker was placed at the highest point within the band no closer than 2.5 MHz from the band edge.

Test Setup

| Signal Generator | → | EUT | → | Attenuator | → | Spectrum Analyzer |

Refer to Annex A for Authorized Frequency Band plots.
Maximum Power and Gain
Engineer: Greg Corbin
**Test Date:** 12/19/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor as needed to ensure accurate readings. The spectrum analyzer and signal generator were tuned to the frequency with the highest power level in the band, as determined by the Authorized Frequency Band test. The RF input level was increased to a point just prior to the AGC being in control of the power for both pulsed single time slot GSM modulation and 4.1 MHz AWGN modulation. The maximum power was measured and verified to meet the minimum and maximum levels allowed, with the maximum gain being computed from these values. The uplink and downlink gain under each condition were verified to be within 9 dB of each other.

The input level was incremented in 2 dB steps up to the maximum input level for the EUT. The output power was recorded at the maximum input level. If the EUT shutdown before the maximum input level was reached, the input level was reduced to 1 dB before the EUT shutdown and the input and output levels were recorded.

For Mobile installations the gain is fixed at 50 dB.

Antenna Gain (dBi)=maximum antenna gain + the minimum cable loss

Test Setup

Signal Generator	→	EUT	→	Attenuator	→	Spectrum Analyzer
Uplink Power Test Results

Frequency Band (MHz)	Input Level (dBm)	Output Power (dBm)	Antenna Gain (dBi)	EIRP (dBm)	Lower Limit (dBm)	Upper Limit (dBm)	Result
698 - 716 MHz Pulsed GSM	-21.8	27.3	2.6	29.9	17	30	Pass

Downlink Output Power at Maximum Input Power Test

Frequency Band (MHz)	Maximum Input Level (dBm)	Output Power at Maximum Input Power (dBm)	Antenna Gain (dBi)	EIRP (dBm)	Upper Limit (dBm)	Result
728 - 746 MHz Pulsed GSM	-23 (EUT shutdown -22dBm)	-0.44	2.67	2.23	17	Pass
728 - 746 MHz AWGN	-23 (EUT shutdown -22dBm)	-0.44	2.67	2.23	17	Pass
746 - 757 MHz Pulsed GSM	-23 (EUT shutdown -22dBm)	1.13	4.22	5.35	17	Pass
746 - 757 MHz AWGN	-23 (EUT shutdown -22dBm)	1.13	4.22	5.35	17	Pass
869 - 894 MHz Pulsed GSM	-23 (EUT shutdown -22dBm)	2.02	4.90	6.92	17	Pass
869 - 894 MHz AWGN	-23 (EUT shutdown -22dBm)	2.02	4.90	6.92	17	Pass
1930 - 1995 MHz Pulsed GSM	-27 (EUT shutdown -26 dBm	1.96	3.90	5.86	17	Pass
1930 - 1995 MHz AWGN	-27 (EUT shutdown -26 dBm	1.96	3.90	5.86	17	Pass
2110 - 2155 MHz Pulsed GSM	-23 (EUT shutdown -22dBm	1.44	2.84	4.28	17	Pass
2110 - 2155 MHz AWGN	-24 (EUT shutdown -23 dBm)	1.44	2.84	4.28	17	Pass

Note: If the DL shuts down before the maximum input power (-20 dBm) is reached, back off the input power to 1 dB before shutdown and record the Input Power, Output Power and the power level that the EUT shutdown
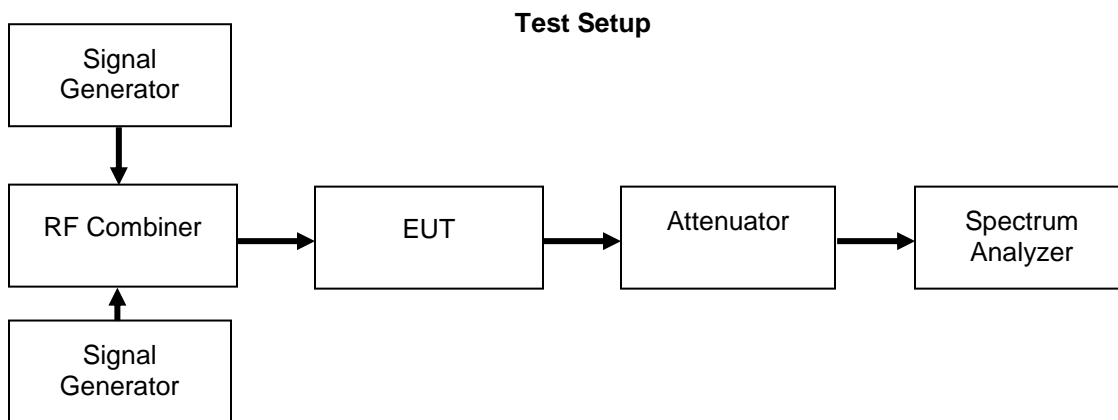

Intermodulation
Engineer: Greg Corbin
Test Date: 12/119/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator. Two signal generators were utilized to produce two CW signals 600 kHz apart and centered at the peak of the operational band. Attenuator and cable insertion loss correction factors were input to either the signal generator or the spectrum analyzer as required to ensure that accurate measurements were recorded. The input power was set at the maximum allowable power and the RMS intermodulation products were measured to ensure they were less than -19 dBm in a 3 kHz RBW. The uplink and downlink intermodulation products were plotted, with the levels being listed in the summary tables.

The input power was increased in 2 dB increments to 10 dB above the AGC threshold and to verify the intermod products remain below the limit. During this test, the input power was not increased past the maximum allowed.
The Intermodulation level was recorded

Test Setup

Signal Generator → RF Combiner ← Signal Generator
RF Combiner → EUT → Attenuator → Spectrum Analyzer

Uplink Test Results

Frequency Band (MHz)	Intermodulation Level (dBm)	Limit (dBm)	Result	Intermod Level with Input Power @ AGC + 10 dB	Result (Pass / Fail)
698 - 716 MHz	-21	-19	Pass	-21.1	Pass
776 - 787 MHz	-20	-19	Pass	-23.6	Pass
824 - 849 MHz	-20.8	-19	Pass	-19.7	Pass

Refer to Annex B for Intermodulation Test plots

Out-of-Band Emissions
Engineer: Greg Corbin
Test Date: 12/21/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor in order to ensure accurate readings. A signal generator was utilized to produce the following signals: GSM, CDMA, and WCDMA. The signal generator was tuned to the lowest allowable upper and lower channel within the EUT operational band for each respective modulation type. The RF input level was increased to a point just prior to the AGC being in control of the power. For each modulation type the Out of Band Emissions were measured to ensure they met the limits.

The following formula was used for calculating the limits:

Limit = P1 - 6 - (43+ 10Log(P2)) = -19dBm
P1 = power in dBm
P2 = power in Watts

The input power was increased in 2 dB steps up to the maximum input power for the booster being tested. The OOBE was verified to stay below the OOBE Limit. This was recorded as Pass / Fail in the OOBE tables.

Per 935210 D03 v04r02 page 13, The test report shall include either a statement describing that the device complies at 10 dB above AGC or at the 5.5 power levels, or a table showing compliance at the additional input power(s) required.

The Booster is compliant to the maximum input levels per FCC KDB 935210 D03 v04r02 section 5.5.

Conducted Spurious Emissions
Engineer: Greg Corbin
Test Date: 12/21/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator, with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor as needed to ensure accurate readings. A signal generator was utilized to produce a 4.1 MHz AWGN signal operating at the maximum allowable power. The conducted spurious emissions from 9 kHz to 10 times the highest tunable frequency for each operational band were measured (excluding the band defined by the Out of band emissions test). The emissions were plotted and the highest level was recorded in the summary table.

The following formulas are used for calculating the limits.

Conducted Spurious Emissions Limit = P1 – (43+ 10Log(P2)) = -13 dBm
P1 = power in dBm
P2 = power in Watts

Test Setup
Uplink Test Results

Frequency Band (MHz)	Measured Frequency (MHz)	Measured Level (dBm)	Limit (dBm)	Result
698 - 716	6189	-32.7	-13	Pass
776 - 787	7795.6	-32	-13	Pass

1850 - 1915	17153	-26.5	-13	Pass

Downlink Test Results

Frequency Band (MHz)	Measured Frequency (MHz)	Measured Level (dBm)	Limit (dBm)	Result
728 - 746	7439.8	-32.1	-13	Pass
746 - 757	6479.1	-32.4	-13	Pass
869 - 894	8290.3	-30.9	-13	Pass
1930 - 1995	19914	-23.2	-13	Pass
2110 - 2155	20856.6	-25	-13	Pass

For the 746 – 758 downlink and 776 – 788 Uplink bands of operation, the following additional spurious emissions requirements apply.

FCC 27.53(c)
For operations in the 746-758 MHz band and the 776-788 MHz band, the power of any emission outside the licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, in accordance with the following:

> *(4) On all frequencies between 763-775 MHz and 793-805 MHz, by a factor not less than 65 + 10 log (P) dB in a 6.25 kHz band segment, for mobile and portable stations;*

776 – 787 MHz Uplink Band

Spurious Frequency Range (MHz)	Measured Frequency (MHz)	Measured Value (dBm)	RBW (kHz)	Final Value (dBm)	Limit (dBm)	Margin (dB)
763 – 775	774.84	-40.5	6.25	-40.50	-35	-5.50
793 – 805	801.95	-57	6.25	-57.00	-35	-22.00

746 - 757 MHz Downlink Band

Spurious Frequency Range (MHz)	Measured Frequency (MHz)	Measured Value (dBm)	RBW (kHz)	Final Value (dBm)	Limit (dBm)	Margin (dB)
763 – 775	771.817	-66.7	6.25	-66.70	-35	-31.70
793 – 805	804.9475	-67.1	6.25	-67.10	-35	-32.10

FCC 27.53(e)

For operations in the 746-758 MHz, 775-788 MHz, and 805-806 MHz bands, emissions in the band 1559-1610 MHz shall be limited to −70 dBW/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and −80 dBW EIRP for discrete emissions of less than 700 Hz bandwidth. For the purpose of equipment authorization, a transmitter shall be tested with an antenna that is representative of the type that will be used with the equipment in normal operation.

Since the limit is referenced to EIRP, the final data is computed using the Conducted Spurious Emission data and adding the BW correction factor plus the final gain/loss data from the antenna kitting information supplied by the manufacturer.

For the Narrowband measurement, the test is performed using a 10 kHz RBW. Since the limit is referenced to a 700 Hz BW, the following correction factor is applied to the measured data.

Final Value (dBm) = conducted measurement + final gain/loss from Antenna Kitting document

The Limit for discreet (narrowband) emissions is -80dBW (-50 dBm) in 700 MHz BW.
The Limit for (wideband Emissions) is -70 dBW (-40 dBm) in a 1 MHz BW.

776 – 787 MHz Uplink Band

Spurious Frequency Range (MHz)	Measured Frequency (MHz)	Measured Value (dBm)	RBW	Gain/Loss from Antenna Kitting Information (dB)	Final Value (dBm)	Limit (dBm)	Margin (dB)
1559 – 1610 (Wideband)	1566	-51.79	1 MHz	2.8	-48.99	-40	-8.99
1559 – 1610 (Narrowband)	1601.89	-81.7	700 Hz	2.8	-78.9	-50	-28.9

746 - 757 MHz Downlink Band

Spurious Frequency Range (MHz)	Measured Frequency (MHz)	Measured Value (dBm)	RBW	Gain/Loss from Antenna Kitting Information (dB)	Final Value (dBm)	Limit (dBm)	Margin (dB)
1559 – 1610 (Wideband)	1598.53	-52	1 MHz	-0.25	-52.25	-40	-12.25
1559 – 1610 (Narrowband)	1595.17	-75.7	700 Hz	-0.25	-75.95	-50	-25.95

Refer to Annex D for Conducted Spurious Emission plots.

Noise Limits
Engineer: Greg Corbin
Test Date: 12/19/2018

<div align="center">

Test Procedure

</div>

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor as necessary to ensure that accurate readings were obtained. A series of three tests were performed: the maximum uplink and downlink noise, the variable noise for the uplink and downlink in the presence of a downlink signal, and the variable uplink noise timing. The detailed procedures from the latest version of KDB 935210 D03 were followed.

For Mobile installations the Noise limit is fixed at 59 dBm.

Variable Noise =-103 dBm/MHz-RSSI

Uplink Inactivity
Engineer: Greg Corbin
Test Date: 12/20/18

Test Procedure

The EUT was connected directly to a spectrum analyzer set to operate in the center of the EUT operational uplink and downlink bands. The span was set to 0 Hz with a sweep time of 330 seconds and MAX HOLD operation. The EUT was powered on and the time for the uplink to return to an inactive state was measured using the DELTA MARKER method to ensure that it was less than 300 seconds. The noise level after the return to an inactive state was less than -70 dBm/MHz.

Test Setup

Variable Gain
Engineer: Greg Corbin
Test Date: 12/21/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor in order to ensure accurate readings were obtained. The uplink gain in the presence of a downlink signal was measured for each operational uplink band using the detailed procedures from the latest version of KDB 935210 D03.

The following formula is used for calculating the limits:

Variable Gain = -34 dB - RSSI +MSCL

Occupied Bandwidth
**Engineer:** Greg Corbin
Test Date: 12/21/2018

Test Procedure

The EUT was connected to a spectrum analyzer through an attenuator with the losses being input into the spectrum analyzer as a combination of reference level offset and correction factor as required to ensure that accurate readings were obtained. A signal generator was utilized to produce the following signals: GSM, CDMA, and WCDMA. The signal generator was tuned to the center channel of each of the EUT operational uplink and downlink bands with the RF level set at a point just prior to the AGC being in control of the power. For each modulation type, the input and output signal was measured and plotted to ensure that the signals were similar.

Test Setup

| Signal Generator | → | EUT | → | Attenuator | → | Spectrum Analyzer |
Refer to Annex H for Occupied Bandwidth plots

Anti-Oscillation
Engineer: Greg Corbin
Test Date: 12/18/2018

Test Procedure

The EUT was connected to a spectrum analyzer set for zero span mode. The EUT uplink and downlink were loop backed to each other through a selectable band pass filter and variable attenuator. The EUT uplink and downlink were tested to ensure that the presence of oscillation was detected and that the EUT output turned off within 300 mS for the Uplink and 1 second for the Downlink and remained off for 1 minute. The time was extended to capture how many times the unit attempted to restart.

Oscillation Mitigation
Engineer: Greg Corbin
Test Date: 12/18/2018

Test Procedure

The EUT was connected as shown per KDB 935210 D03. The EUT was verified to shut down in the presence of an oscillation.

The total attenuation from output to input was set +5 dB higher than the gain for the band being tested.

For EUT's that do not shutdown, the peak oscillation was measured and the variable attenuator was reduced in 1 dB increments until the booster shuts off.

The frequency and amplitude of the highest oscillation and the lowest level in the valley next to the oscillation was recorded for each 1 dB step as required per the KDB.

For oscillations that exceeded the 12 dB limit, the time required for the booster to mitigate the oscillation to less than 12 dB was recorded.

If the booster mitigated the oscillation within the 300 second time limit, the time required to mitigate the oscillation was recorded along with the final level of the oscillation after mitigation.

Note: In all cases the booster mitigated the oscillation to less than 12 dB before the 300 second limit.

Radiated Spurious
Engineer: Greg Corbin
Test Date: 1/3/2018

<div align="center">

Test Procedure

</div>

The EUT was tested in a semi-anechoic chamber with the turntable set 3m from the receiving antenna. A spectrum analyzer was used to verify that the EUT met the requirements for Radiated Emissions. The EUT was tested by rotating it 360 degrees with the antenna in both the vertical and horizontal orientation while raised from 1 to 4 meters to ensure that the signal levels were maximized. All cable and antenna correction factors were input into the spectrum analyzer ensuring an accurate measurement in ERP/EIRP with the resultant power in dBm. A signal generator was used to provide a CW signal centered in each operational uplink and downlink band. The EUT output was terminated into a 50 Ohm non-radiating load.
30 MHz to the 10th harmonic of the fundamental was investigated.

The following formula was used for calculating the limits:

Radiated Spurious Emissions Limit = P1 – (43+ 10Log(P2)) = -13dBm
P1 = power in dBm
P2 = power in Watts

<div align="center">

Test Setup

</div>

Refer to Annex J for Radiated Spurious Emission plots

All emissions were lower than -19 dBm.

Test Equipment Utilized

Description	Manufacturer	Model #	CT Asset #	Last Cal Date	Cal Due Date
Horn Antenna	EMCO	3115	i00103	2/3/17	2/3/19
Bi-Log antenna	Chase	CBL6111C	i00267	3/8/18	3/8/20
Horn Antenna	ARA	DRG-118/A	i00271	6/16/18	6/16/20
Horn Antenna, Amplified	ARA	MWH-1826/B	i00273	5/22/18	5/22/21
Humidity / Temp Meter	Newport	IBTHX-W-5	i00282	6/29/18	6/29/19
Signal Generator	Rohde & Schwarz	SMU200A	i00405	5/10/18	5/10/19
Spectrum Analyzer	Textronix	RSA5126A	i00424	5/9/18	5/9/19
3 Meter Semi-Anechoic Chamber	Panashield	3 Meter Semi-Anechoic Chamber	i00428	8/15/16	8/15/19
Voltmeter	Fluke	179	i00488	4/24/18	4/24/19
Preamplifier	Miteq	AFS44 00101 400 23-10P-44	i00509	N/A	N/A
Combilog Antenna	Com-Power	AC-220	Rental S/N: 10030012	12/19/18	12/19/19

In addition to the above listed equipment standard RF connectors and cables were utilized in the testing of the described equipment. Prior to testing these components were tested to verify proper operation.

END OF TEST REPORT
