Equipment requiring calibration is calibrated periodically by the manufacturer or according to manufacturer's specifications. Additionally all equipment is verified for proper performance on a regular basis using in house standards or comparisons.

All measurement equipment calibrations are traceable to DKD or where calibration is performed outside Germany, to equivalent nationally recognized standards organizations.

The measurement facilities for conducted and for radiated disturbances of TRPS GmbH in Cologne, Am Grauen Stein, has been found to be in compliance with the requirements of Section 2.948 of the FCC Rules. Measurement data will be accepted in conjunction with applications for Certification under Parts 15 and 18 of the Commission´s Rules.

3. Prüfaufbau [EUT configuration]

Der Prüfaufbau erfolgte entsprechend den Angaben der genannten EMV-Normen.
Die Messungen und Tests wurden unter "worst case"-Bedingungen durchgeführt, d.h., es wurden typische Anordnungen und Betriebszustände gewählt bzw. angenommen und für maximale Störaussendung optimiert (sogenannte ”Ungünstigste Konfiguration”).
Die maximalen Störaussendungswerte wurden dokumentiert.
Einzelheiten sind (auch) der Fotodokumentation zu entnehmen, in der die Konfigurationen maximaler Störaussendung dargestellt sind.
Soweit nicht anders angegeben, gelten diese Angaben für alle nachfolgenden Messungen.

[The test setup was made in accordance with mentioned EMC standards.
Measurements and tests were executed under ”worst case” conditions. Typical EUT arrangements or operating modes were chosen or assumed and for maximum emission optimized (a so called ”unfavourable configuration”).
Maximum emissions are reported.
Details of test setup or adjustments are (also) shown inside the photo documentation, in which configurations of maximum emission are displayed.
As far as not mentioned otherwise these statements are valid for all following tests.]

The EUT is placed on a non-conducting table 40 cm from the vertical ground plane and 80 cm above the horizontal ground plane. The EUT is configured in accordance with ANSI C63.4:2003. The resolution bandwidth is set to 9 kHz for both peak detection and quasi-peak detection measurements. Peak detection is used unless otherwise noted as quasi-peak. Line conducted data is recorded for both NEUTRAL and HOT lines. A 50 µH/50 ohms line impedance stabilization network (LISN) was used.

Field Strength Calculations:

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured level. The basic equation with a sample calculation is as follows:

Where: Field Strength = Measured Level + Antenna Factor + Cable Attenuation Factor – Amplifier Gain

Example: FS = 30,0 + 7,4 + 1,1 - 0 = 38,5dBuV/m

Level in uV/m = Common Antilogarithm [(38,5dBuV/m)/20] = 84,1uV/m

Datum [date]: 2007-01-12

Frequency / GHz	Peak	Average
2.4044	4.79 mV	4.79 mV
4.8155	281.18 µV	281.18 µV
9.6133	46.4 µV	46.4 µV

X, Y and Z positions were tested and “X” position was found to be worst case.

The EUT is placed on a non-conducting table 80 cm above the ground plane. The antenna to EUT distance is 3 meters. The EUT is configured in accordance with ANSI C63.4:2003.
The frequency range of interest is monitored at a fixed antenna height and EUT azimuth. The EUT is rotated through 360 degrees to maximize emissions received. The antenna is scanned from 1 to 4 meters above the ground plane to further maximize the emission. Measurements are made with the antenna polarized in both the vertical and the horizontal positions. The Analyser was set to max. hold. All test was performed with Peak and Average detector. All values are the same. The Res.Bw and Vid.Bw for the above table is 1 MHz. The report shows the mas. value we found from both EUT’s.

After switch on GL-402 or RC-402 they try to connect each other. The transmitter switch on approximately all 250 msek. This will be done until you switch off the EUT. In this case we have a nearly continue transmission.
