**SAR measurement  
for wireless telephone**

Model	RTX 2G4
IPEI	00064801A6
Date of Measurement:	12/20/00 and 01/18/01
Number of measurements	14
Measurement Report:	02/07/01

Contract awarder: ETS Dr. Genz GmbH  
Contract acceptor: T-Nova GmbH  
Direction: Dr.-Ing. B. Marx, E561a  
Measurement: Dipl.-Ing. J. Buhl, E561g  
Report: Dipl.-Ing. J. Buhl, E561g

# Contents

1. General Description and Explanation
  - 1.1 Measurement parameters
  - 1.2 Precision of Measurement
2. Measurement procedure
  - 2.1 Description of telephone positioning
  - 2.2 Important points; other matters
3. Overview of the individual measurements and summary of the measured values
4. Graphical presentation of the measured values

## 1. General Description and Explanation

### 1.1 Measurement parameters

Measured frequencies                    f                    = 2400 to 2480MHz

Conversion factor of probe              ConF            = 4.8

Max. depth of liquid in phantom      h                    = 12 cm

Electrical characteristics of liquid in the phantom, which approximate the mean values from those of grey and white brain tissue (after Gabriel):

$$\epsilon_r = 38.0$$

$$\sigma = 2.49$$

### 1.2 Measurement precision

The obtainable precision corresponds to the precision of the measurement platform at the time of delivery from the manufacturer. Since that time no change of hardware has been made. The measurement software has been updated to Version 3.1c.

## 2. Measurement procedure

### 2.1 Description of telephone positioning

The basis for the measurements is the European Specification ES 59005 of October 1998, referred hereafter as "CENELEC" or "CENELEC Draft Standards" for brevity.

The measurement procedure with the portable part was carried out so that the positions listed below correspond to the diagram shown in the CENELEC Draft Standards, section 6.3.1.1, for the left side of the head of the "Generic Twin Phantom".

1. "intended use position" corresponds to point (1) of the CENELEC Draft Standards,
2. "Optional condition 1 (touching position)" corresponds to point (2) of the CENELEC Draft Standards, the angle between the reference line of the phone and the line connecting the auditory canal openings reduced until the device touches the face of the phantom the first time, with a rubber ring of 2 mm thick material simulating the users ear.
3. "Optional condition 2 (100° rotated backwards)" corresponds to CENELEC point (3),
4. "Optional condition 3 (tilted position)" corresponds to CENELEC point (4).

The fixed part has been measured in the following positions::

1. Touching the flat part of the "Generic Twin Phantom" with the centre of the case,
2. touching the flat part of the "Generic Twin Phantom" nearest with the antenna,
3. touching the head of the phantom besides the ear with the centre of the case,
4. touching the head of the phantom besides the ear nearest with the antenna.

## 2.2 Important points; other matters

- none -

**3. Overview of the individual measurements and summary of the measured values**

Device	Position	2400 MHz		2440 MHz		2480 MHz	
		SAR 1g	SAR 10g	SAR 1g	SAR 10g	SAR 1g	SAR 10g
portable part	intended use			0,16	0,076		
	touching			0,12	0,063		
	100°			0,15	0,073		
	tilted	0,21	0,1	0,17	0,082	0,18	0,086
fixpart, ant. 1	head, centre			0,085	0,047		
fixpart, ant. 2				0,09	0,049		
fixpart, ant. 1	head, antenna			0,13	0,067		
fixpart, ant. 2				0,24	0,11		
fixpart, ant. 1	flat, centre			0,12	0,065		
fixpart, ant. 2				0,11	0,055		
fixpart, ant. 1	flat, antenna			0,18	0,083		
fixpart, ant. 2				0,13	0,072		
all SAR values in mW/g							

The measured 10g values are a factor of more than 15 under the prescribed value.

**4. Graphical presentation of the measured values**

Displayed are the results from area sampling "coarse scan" of each position.

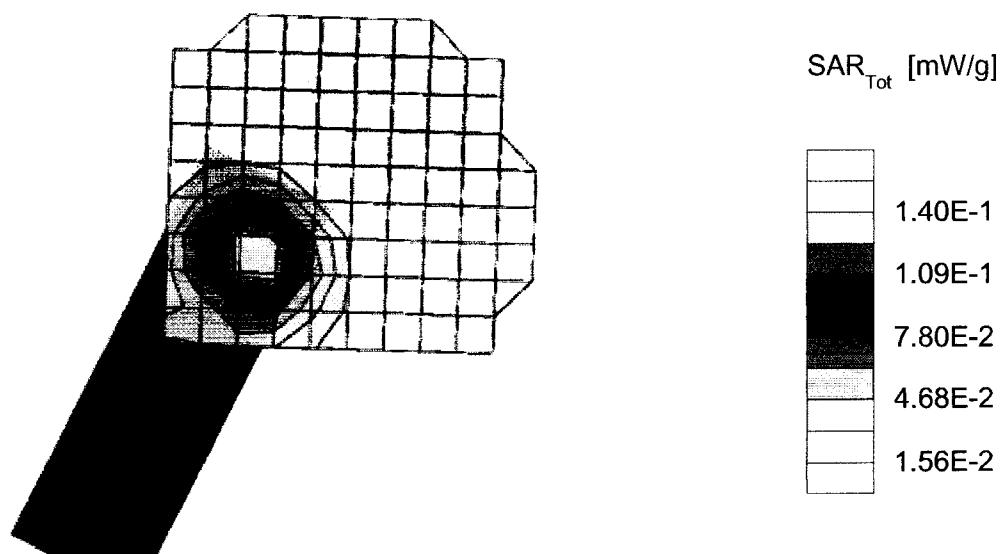

# RTX Kirk Z-3040

Intended use

Generic Twin; Left Hand

Frequency: 2440 MHz;  $\sigma = 2.49 \text{ mho/m}$   $\epsilon_r = 38.0$   $\rho = 1.00 \text{ g/cm}^3$

SAR (1g): 0.159 mW/g, SAR (10g): 0.0757 mW/g

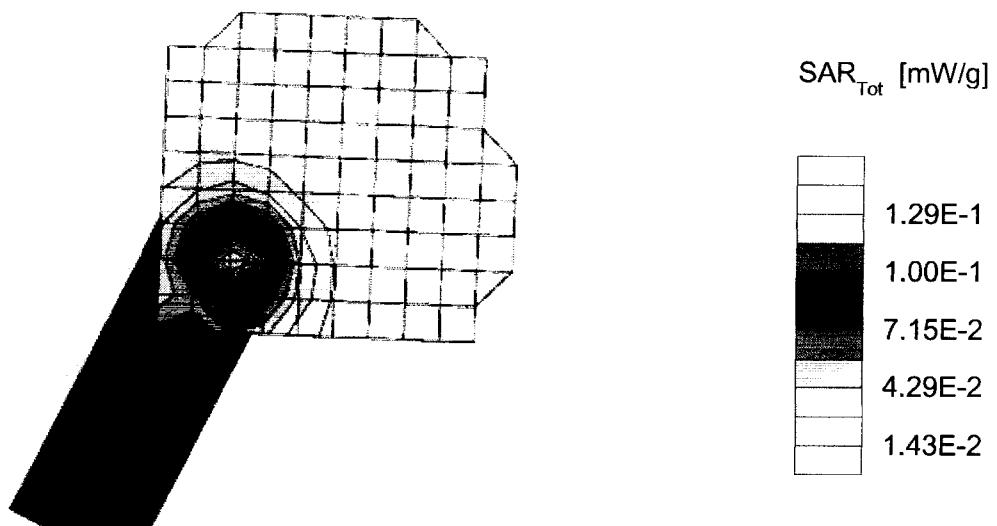

# RTX Kirk Z-3040

Touching

Generic Twin; Left Hand

Frequency: 2440 MHz;  $\sigma = 2.49 \text{ mho/m}$   $\epsilon_r = 38.0$   $\rho = 1.00 \text{ g/cm}^3$

SAR (1g): 0.124 mW/g, SAR (10g): 0.0626 mW/g

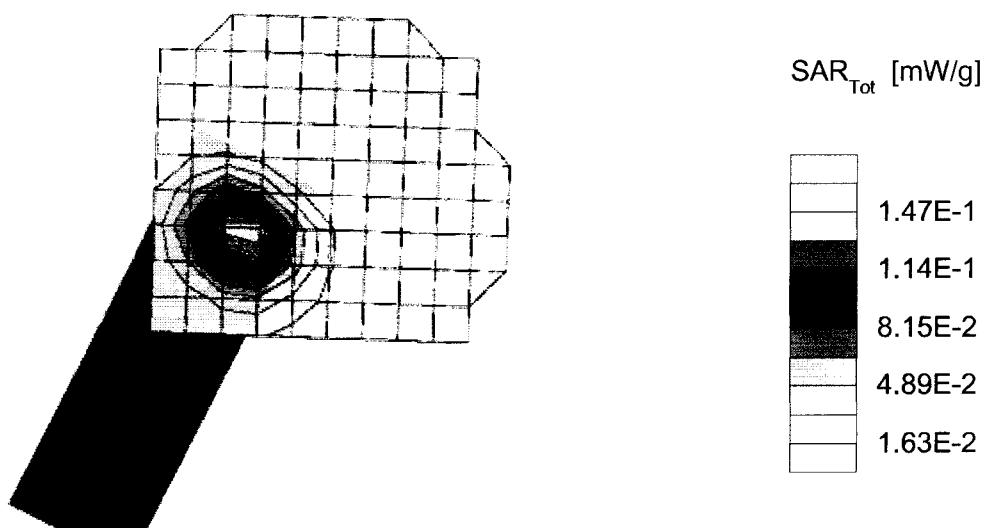

# RTX Kirk Z-3040

Position 100°

Generic Twin; Left Hand

Frequency: 2440 MHz;  $\sigma = 2.49 \text{ mho/m}$   $\epsilon_r = 38.0$   $\rho = 1.00 \text{ g/cm}^3$

SAR (1g): 0.154 mW/g, SAR (10g): 0.0728 mW/g

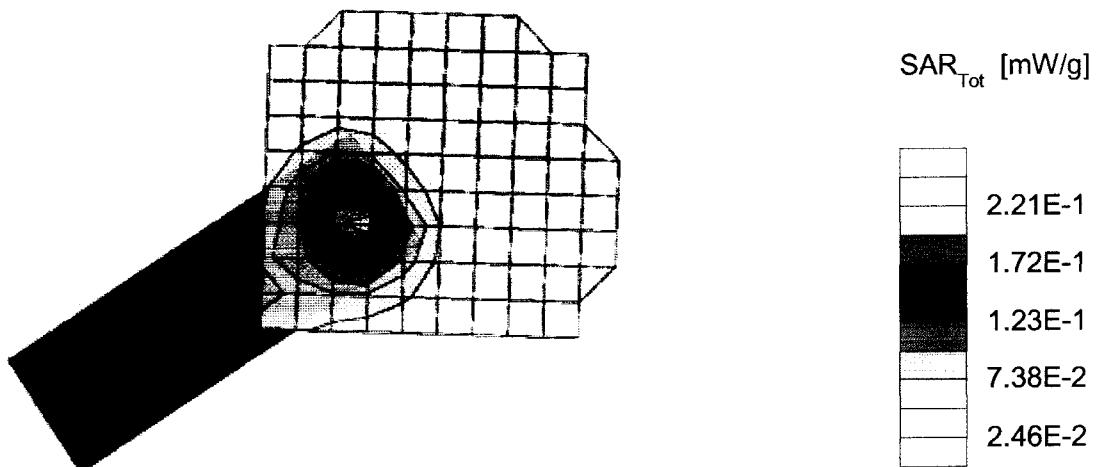

# RTX Kirk Z-3040

Tilted, TX\_0

Generic Twin; Left Hand

Frequency: 2400 MHz;  $\sigma = 2.49 \text{ mho/m}$   $\epsilon_r = 38.0$   $\rho = 1.00 \text{ g/cm}^3$

SAR (1g): 0.212 mW/g, SAR (10g): 0.102 mW/g
