2. Test Configuration of Equipment under Test

2.1 Feature of Equipment under Test

•	Multiple Operating Modes
-	Wireless Access Point. Operates as a standard 802.11a/g.
-	Point-to-Point Bridge. In this mode, the WAG102 only communicates with another bridge-mode wireless station. You must enter the MAC address (physical address) of the other bridge-mode wireless station in the field provided. WEP should be used to protect this communication.
-	Point-to-Multi-Point Bridge. Select this only if this WAG102 is the “Master” for a group of bridge-mode wireless stations. The other bridge-mode wireless stations must be set to Point-to-Point Bridge mode, using this WAG102's MAC address. They then send all traffic to this “Master”, rather than communicate directly with each other. WEP should be used to protect this traffic.
-	Wireless Repeater. In this half-duplex mode, the WAG102 only communicates with another repeater-mode wireless station. You must enter the MAC address of the root access point. WEP should be used to protect this communication.
•	Upgradeable Firmware. Firmware is stored in a flash memory and can be upgraded easily, using only your Web browser, and can be upgraded remotely.
•	Access Control. The Access Control MAC address filtering feature can ensure that only trusted wireless stations can use the WAG102 to gain access to your LAN.
•	Simple Configuration. If the default settings are unsuitable, they are easy to change.
•	Hidden Mode. The SSID is not broadcast, assuring only clients configured with the correct SSID can connect.
•	Secure Telnet Command Line Interface. The Telnet command line interface enables direct access over the serial port and easy scripting of configuration of multiple WAG102s across an extensive network via the Ethernet interface. An SSH client is required.
•	Configuration Backup. Configuration settings can be backed up to a file and restored.
•	Secure and Economical Operation. Adjustable power output allows more secure or economical operation.
•	Power over Ethernet. Power can be supplied to the WAG102 over the Ethernet port from any 802.3af compliant mid-span or end-span source such as the NETGEAR FSM7326P Managed Power over Ethernet Layer 3 managed switch.
•	Autosensing Ethernet Connection with Auto Uplink Interface. Connects to 10/100 Mbps IEEE 802.3 Ethernet networks.
•	LED Indicators. Power, test, LAN speed, LAN activity, and wireless activity are easily identified.

4. Test of Conducted Emission (For 802.11b/g device)

4.1 Test Limit

Conducted Emissions were measured from 150 kHz to 30 MHz with a bandwidth of 9 KHz on the 115 VAC power and return leads of the EUT according to the methods defined in ANSI C63.4-2003 Section 3.1. The EUT was placed on a nonmetallic stand in a shielded room 0.8 meters above the ground plane as shown in section 2.2. The interface cables and equipment positioning were varied within limits of reasonable applications to determine the position produced maximum conducted emissions.

Frequency (MHz)	Quasi Peak (dB μ V)	Average (dB μ V)
0.15 – 0.5	66-56*	56-46*
0.5 – 5.0	56	46
5.0 – 30.0	60	50

*Decreases with the logarithm of the frequency.

4.2 Test Procedures

- a. The EUT was placed 0.4 meter from the conducting wall of the shielding room was kept at least 80 centimeters from any other grounded conducting surface.
- b. Connect EUT to the power mains through a line impedance stabilization network (LISN).
- c. All the support units are connecting to the other LISN.
- d. The LISN provides 50 ohm coupling impedance for the measuring instrument.
- e. The FCC states that a 50 ohm, 50 micro-Henry LISN should be used.
- f. Both sides of AC line were checked for maximum conducted interference.
- g. The frequency range from 150 kHz to 30 MHz was searched.
- h. Set the test-receiver system to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
