Measurement System Information

General Information

Testing Condition:

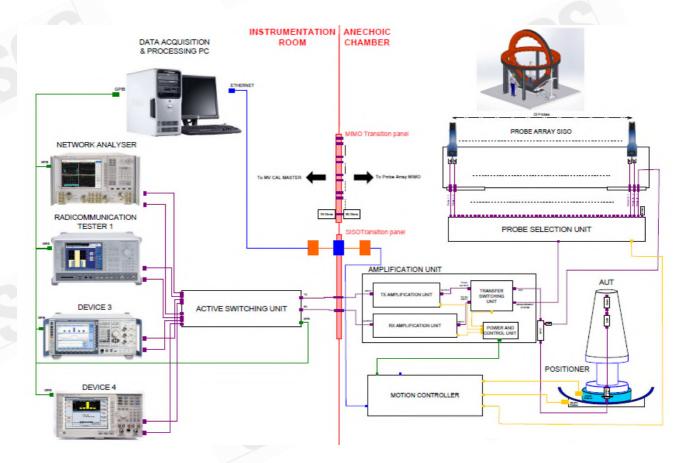

• Temperature: 22±3°C

• Humidity: <80%

Measurement Facility:

• Measurement Chamber: MVG 3D fully anechoic chamber and its measuring system (Stargate-24-L)

• Network Analyzer: Agilent E5071C

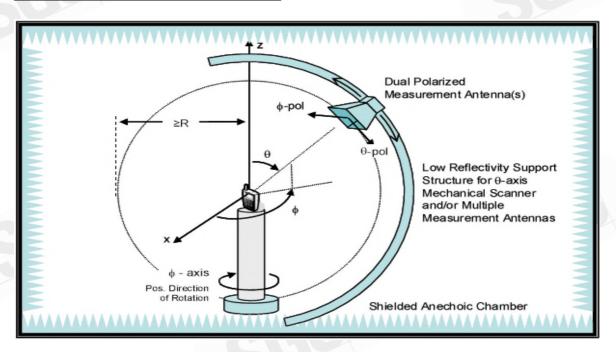

Page No.: 3 of 19

Measurements are performed in a MVG **Stargate-24-L** with the StarAct interface for a base station simulator. The **Stargate-24-L** has 23 probe antennas mounted with equal spacing on a circular arch. Electronic switching of the probe antennas provides outstanding measurement speed. The geometry of the setup, with only a Styrofoam column within 1.6 meters of the EUT, ensures minimum interference and low ripple on the measured radiation patterns. The EUT is placed on top of the pedestal, in the center of the system.

MVG **Stargate-24-L** uses analog RF signal generators to emit EM waves from the probe array to the EUT. It uses the NPAC as an RF receiver for antenna measurements.

We test gain by illuminating the EUT with a frequency swept RF signal from anechoic chamber "source antennas". Then measure the EUT's gain (dBi) via the substitution method. The substitution method involves setting up the calibrated standard antenna over a radiated path accross the chamber, then normalizing (or "zeroing") that path loss to 0 dB. Then substitute EUT in place of standard antenna, and re-measure the change in path loss. By simply adding standard antenna's calibrated gain (dBi) to the change in path loss, it can determine EUT gain in dBi. In other words, the EUT's gain is measured relative to the standard antenna.

Typical Setup for MVG Stargate-24-L:
