# PART 2 RF EXPOSURE EVALUATION REPORT

**Applicant Name:** 

Sony Mobile Communications Inc. 4-12-3 Higashi-Shinagawa Shinagawa-ku Tokyo, 140-0002, Japan

**Date of Testing:** 

09/01/2020 - 10/15/2020

Test Site/Location:

PCTEST, Columbia, MD, USA

**Document Serial No.:** 1M2007070106-02.PY7

FCC ID: PY7-57441Y

SONY MOBILE COMMUNICATION INC. APPLICANT:

DUT Type: Portable Handset **Application Type:** Certification FCC Rule Part(s): CFR §2.1093

**Device Serial Numbers:** Pre-Production Samples [0D8JC, 0AD49, 0DRJC, 80995]

I attest to the accuracy of data. All measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them. Test results reported herein relate only to the item(s) tested.

#### 1.2 Time-Averaging Algorithm for RF Exposure Compliance

The device under test (DUT) contains:

a. Qualcomm® SDX55M modems supporting 2G/3G/4G/5G NR WWAN technologies

Qualcomm® SDX55M modem is enabled with Qualcomm® Smart Transmit feature. This feature performs time averaging algorithm in real time to control and manage transmitting power and ensure the time-averaged RF exposure is in compliance with FCC requirements all the time.

The Smart Transmit algorithm maintains the time-averaged transmit power, in turn, time-averaged RF exposure of SAR\_design\_target or PD\_design\_target, below the predefined time-averaged power limit (i.e., P<sub>limit</sub> for sub-6 radio, and input. power. limit for 5G mmW NR), for each characterized technology and band.

Smart Transmit allows the device to transmit at higher power instantaneously, as high as  $P_{max}$ , when needed, but enforces power limiting to maintain time-averaged transmit power to  $P_{limit}$  for frequencies < 6 GHz and input. power. limit for frequencies > 6 GHz.

Note that the device uncertainty for sub-6GHz WWAN is 1.0dB for this DUT, the device uncertainty for mmW is 2.1dB, and the reserve power margin is 3dB.

This purpose of the Part 2 report is to demonstrate the DUT complies with FCC RF exposure requirement under Tx varying transmission scenarios, thereby validity of Qualcomm<sup>®</sup> Smart Transmit feature implementation in this device. It serves to compliment the Part 0 and Part 1 Test Reports to justify compliance per FCC.

### RF EXPOSURE LIMITS

#### 2.1 **Uncontrolled Environment**

UNCONTROLLED ENVIRONMENTS are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure. The general population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity.

#### 2.2 **Controlled Environment**

CONTROLLED ENVIRONMENTS are defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure, (i.e. as a result of employment or occupation). In general, occupational/controlled exposure limits are applicable to situations in which persons are exposed as a consequence of their employment, who have been made fully aware of the potential for exposure and can exercise control over their exposure. This exposure category is also applicable when the exposure is of a transient nature due to incidental passage through a location where the exposure levels may be higher than the general population/uncontrolled limits, but the exposed person is fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

#### 2.3 RF Exposure Limits for Frequencies Below 6 GHz

Table 2-1 SAR Human Exposure Specified in ANSI/IEEE C95.1-1992 and Health Canada Safety Code 6

HUMAN EXPOSURE LIMITS				
	UNCONTROLLED ENVIRONMENT General Population (W/kg) or (mW/g)	CONTROLLED ENVIRONMENT Occupational (W/kg) or (mW/g)		
Peak Spatial Average SAR <sub>Head</sub>	1.6	8.0		
Whole Body SAR	0.08	0.4		
Peak Spatial Average SAR Hands, Feet, Ankle, Wrists, etc.	4.0	20		

- The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate
- The Spatial Average value of the SAR averaged over the whole body.
- The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

#### 2.4 RF Exposure Limits for Frequencies Above 6 GHz

Per §1.1310 (d)(3), the MPE limits are applied for frequencies above 6 GHz. Power Density is expressed in units of  $W/m^2$  or  $mW/cm^2$ .

Peak Spatially Averaged Power Density was evaluated over a circular area of  $4cm^2$  per interim FCC Guidance for near-field power density evaluations per October 2018 TCB Workshop notes.

> Table 2-2 Human Exposure Limits Specified in FCC 47 CFR §1.1310

Human Exposure to Radiofrequency (RF) Radiation Limits						
Frequency Range [MHz] Power Density Averaging Time [Minutes]						
(A) Limit	(A) Limits for Occupational / Controlled Environments					
1,500 – 100,000 5.0 6						
(B) Limits for General Population / Uncontrolled Environments						
1,500 – 100,000	1.0	30				

Note:  $1.0mW/cm^2$  is  $10W/m^2$ 

#### 2.5 **Time Averaging Windows for FCC Compliance**

Per October 2018 TCB Workshop Notes, the below time-averaging windows can be used for assessing timeaveraged exposures for devices that are capable of actively monitoring and adjusting power output over time to comply with exposure limits.

Interim Guidance	Frequency (GHz)	Maximum Averaging Time (sec)
SAR	< 3	100
SAK	3 – 6	60
	6 - 10	30
	10 - 16	14
	16 - 24	8
MPE	24 – 42	4
	42 – 95	2

# 3 TIME VARYING TRANSMISSION TEST CASES

To validate the time averaging feature and demonstrate the compliance in Tx varying transmission conditions, the following transmission scenarios are covered in the Part 2 test:

- 1. During a time-varying Tx power transmission: To prove that the Smart Transmit feature accounts for Tx power variations in time accurately.
- 2. During a call disconnect and re-establish scenario: To prove that the Smart Transmit feature accounts for history of past Tx power transmissions accurately.
- 3. During a technology/band handover: To prove that the Smart Transmit feature functions correctly during transitions in technology/band.
- 4. During a DSI (Device State Index) change: To prove that the Smart Transmit feature functions correctly during transition from one device state (DSI) to another.
- During an antenna (or beam) switch: To prove that the Smart Transmit feature functions correctly during transitions in antenna (such as AsDiv scenario) or beams (different antenna array configurations) or beams (different antenna array configurations).
- 6. SAR vs. PD exposure switching during sub-6+mmW transmission: To prove that the Smart Transmit feature functions correctly and ensures total RF exposure compliance during transitions in SAR dominant exposure, SAR+PD exposure, and PD dominant exposure scenarios.
- During time window switch: To prove that the Smart Transmit feature correctly handles the transition from one time window to another specified by FCC, and maintains the normalized time-averaged RF exposure to be less than normalized FCC limit of 1.0 at all times.
- 8. SAR exposure switching between two active radios (radio1 and radio2): To prove that the Smart Transmit feature functions correctly and ensures total RF exposure compliance when exposure varies among SAR\_radio1 only, SAR\_radio1 + SAR\_radio2, and SAR\_radio2 only scenarios.

As described in Part 0 report, the RF exposure is proportional to the Tx power for a SAR- and PD-characterized wireless device. Thus, feature validation in Part 2 can be effectively performed through conducted (for f < 6GHz) and radiated (for  $f \ge 6GHz$ ) power measurement. Therefore, the compliance demonstration under dynamic transmission conditions and feature validation are done in conducted/radiated power measurement setup for transmission scenario 1 through 8.

To add confidence in the feature validation, the time-averaged SAR and PD measurements are also performed but only performed for transmission scenario 1 to avoid the complexity in SAR and PD measurement (such as, for scenario 3 requiring change in SAR probe calibration file to accommodate different bands and/or tissue simulating liquid).

The strategy for testing in Tx varying transmission condition is outlined as follows:

- Demonstrate the total RF exposure averaged over FCC defined time windows does not exceed FCC's SAR and PD limits, through <u>time-averaged power</u> measurements
  - o Measure conducted Tx power (for f < 6GHz) versus time, and radiated Tx power (EIRP for f > 10GHz) versus time.
  - Convert it into RF exposure and divide by respective FCC limits to get normalized exposure versus time.
  - Perform running time-averaging over FCC defined time windows.
  - Demonstrate that the total normalized time-averaged RF exposure is less than 1 for all transmission scenarios (i.e., transmission scenarios 1, 2, 3, 4, 5, 6, 7, and 8) at all times.

### Mathematical expression:

For  $f < 6 \, GHz$  transmission only:

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
 (1a)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)dt}{FCC SAR \ limit} \le 1 \tag{1b}$$

For Sub6 + mmW transmission:

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
(2a)

$$4cm^{2}PD(t) = \frac{radiated\_Tx\_power(t)}{radiated\_Tx\_power\_input.power.limit} * 4cm^{2}PD\_input.power.limit$$
(2b)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)dt}{FCC\ SAR\ limit} + \frac{\frac{1}{T_{PD}} \int_{t-T_{PD}}^{t} 4cm^2PD(t)dt}{FCC\ 4cm^2\ PD\ limit} \le 1 \tag{2c}$$

where,  $conducted\_Tx\_power(t)$ ,  $conducted\_Tx\_power\_P_{limit}$ , and  $1g\_or\_10gSAR\_P_{limit}$  correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at  $P_{limit}$ , and measured 1gSARor 10gSAR values at  $P_{limit}$  corresponding to sub-6 transmission. Similarly,  $radiated\_Tx\_power(t)$ , radiated\_Tx\_power\_input.power.limit, and 4cm<sup>2</sup>PD\_input.power.limit correspond to the measured instantaneous radiated Tx power, radiated Tx power at input. power.limit (i.e., radiated power limit), and  $4cm^2PD$  value at input.power.limit corresponding to mmW transmission. Both  $P_{limit}$  and input.power.limitare the parameters pre-defined in Part 0 and loaded via Embedded File System (EFS) onto the EUT.  $T_{SAR}$  is the FCC defined time window for sub-6 radio;  $T_{PD}$  is the FCC defined time window for mmW radio.

- Demonstrate the total RF exposure averaged over FCC defined time windows does not exceed FCC's SAR and PD limits, through time-averaged SAR and PD measurements. Note as mentioned earlier, this measurement is performed for transmission scenario 1 only.
  - For sub-6 transmission only, measure instantaneous SAR versus time; for LTE + sub-6 NR transmission, request low power (or all-down bits) on LTE so that measured SAR predominantly corresponds to sub-6 NR.
  - For LTE + mmW transmission, measure instantaneous E-field versus time for mmW radio and instantaneous conducted power versus time for LTE radio.
  - Convert it into RF exposure and divide by respective FCC limits to obtain normalized exposure versus time.
  - Perform time averaging over FCC defined time window.
  - Demonstrate that the total normalized time-averaged RF exposure is less than 1 for transmission scenario 1 at all times.

### Mathematical expression:

For sub-6 transmission only:

$$1g\_or\_10gSAR(t) = \frac{pointSAR(t)}{pointSAR\_P_{limit}} * 1g\_or\_10gSAR(t)\_P_{limit}$$
(3a)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)dt}{FCC\ SAR\ limit} \le 1 \tag{3b}$$

For LTE + mmW transmission:

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
 (4a)

$$4cm^2PD(t) = \frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2} * 4cm^2PD\_input.power.limit$$
 (4b)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)dt}{FCC\ SAR\ limit} + \frac{\frac{1}{T_{PD}} \int_{t-T_{PD}}^{t} 4cm^2PD(t)dt}{FCC\ 4cm^2PD\ limit} \le 1 \tag{4c}$$

where, pointSAR(t),  $pointSAR\_P_{limit}$ , and  $1g\_or\_10gSAR\_P_{limit}$  correspond to the measured instantaneous point SAR, measured point SAR at  $P_{limit}$ , and measured 1gSAR or 10gSAR values at  $P_{limit}$  corresponding to sub-6 transmission. Similarly, pointE(t),  $pointE\_input.power.limit$ , and  $4cm^2PD\_input.power.limit$  correspond to the measured instantaneous E-field, E-field at input.power.limit, and  $4cm^2PD$  value at input.power.limit corresponding to mmW transmission.

Note: cDASY6 measurement system by Schmid & Partner Engineering AG (SPEAG ) of Zurich, Switzerland measures relative E-field, and provides ratio of  $\frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2}$  versus time.

# FCC MEASUREMENT PROCEDURES (FREQ < 6 GHZ)

This chapter provides the test plan and test procedure for validating Qualcomm Smart Transmit feature for sub-6 transmission. The 100 seconds time window for operating f < 3GHz is used as an example to detail the test procedures in this chapter. The same test plan and test procedures described in this chapter apply to 60 seconds time window for operating  $f \ge 3GHz$ .

#### 4.1 Test sequence determination for validation

Following the FCC recommendation, two test sequences having time-variation in Tx power are predefined for sub-6 (f < 6 GHz) validation:

- Test sequence 1: request DUT's Tx power to be at maximum power, measured  $P_{max}^{\dagger}$ , for 80s, then requesting for half of the maximum power, i.e., measured  $P_{max}/2$ , for the rest of the time.
- Test sequence 2: request DUT's Tx power to vary with time. This sequence is generated relative to measured  $P_{max}$ , measured  $P_{limit}$  and calculated  $P_{reserve}$  (= measured  $P_{limit}$  in dBm - Reserve power margin in dB) of DUT based on measured Plimit.

The details for generating these two test sequences is described and listed in Appendix E.

For test sequence generation, "measured  $P_{limit}$ " and "measured  $P_{max}$ " are used instead of the " $P_{limit}$ " specified in EFS entry and " $P_{max}$ " specified for the device, because the Smart Transmit feature operates against the actual power level of the "Plimit" that was calibrated for the DUT. The "measured  $P_{limit}$ " accurately reflects what the feature is referencing to, therefore, it should be used during feature validation testing. The RF tune up and device-to-device variation are already considered in Part 0 report prior to determining Plimit.

#### 4.2 Test configuration selection criteria for validating Smart Transmit feature

For validating the Smart Transmit feature, this section provides the general guidance to select test cases.

# Test configuration selection for time-varying Tx power transmission

The Smart Transmit time averaging feature operation is independent of bands, modes, and channels for a given technology, Hence, validation of Smart Transmit in one band/mode/channel per technology is sufficient. Two bands per technology are proposed and selected for this testing to provide high confidence in this validation.

The criteria for the selection are based on the Plimit values determined in Part 0 report. Select two bands\* in each supported technology that correspond to least\*\* and highest\*\*\* Plimit values that are less than Pmax for validating Smart Transmit.

- \* If one P<sub>limit</sub> level applies to all the bands within a technology, then only one band needs to be tested. In this case, within the bands having the same  $P_{limit}$ , the radio configuration (e.g., # of RBs, channel#) and device position that correspond to the highest measured 1gSAR at Plimit shown in Part 1 report is selected.
- \*\* In case of multiple bands having the same least  $P_{limit}$  within the technology, then select the band having the highest measured 1gSAR at Plimit.
- \*\*\* The band having a higher  $P_{limit}$  needs to be properly selected so that the power limiting enforced by Smart Transmit can be validated using the pre-defined test sequences. If the highest Plimit in a technology is too high where the power limiting enforcement is not needed when testing with the pre-defined test sequences, then the

FCC ID: PY7-57441Y	Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by:  Quality Manager
Document S/N:	Test Dates:	DUT Type:		D 40 -f 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 10 of 91
© 2020 PCTEST				REV 1.0

**REV 1.0** 04/06/2020 next highest level is checked. This process is continued within the technology until the second band for validation testing is determined.

# 4.2.2 Test configuration selection for change in call

The criteria to select a test configuration for call-drop measurement is:

- Select technology/band with least P<sub>limit</sub> among all supported technologies/bands, and select the radio configuration (e.g., # of RBs, channel#) in this technology/band that corresponds to the highest measured 1gSAR at P<sub>limit</sub> listed in Part 1 report.
- In case of multiple bands having same least  $P_{limit}$ , then select the band having the highest measured 1gSAR at  $P_{limit}$  in Part 1 report.

This test is performed with the DUT's Tx power requested to be at maximum power, the above band selection will result in Tx power enforcement (i.e., DUT forced to have Tx power at  $P_{reserve}$ ) for longest duration in one FCC defined time window. The call change (call drop/reestablish) is performed during the Tx power enforcement duration (i.e., during the time when DUT is forced to have Tx power at  $P_{reserve}$ ). One test is sufficient as the feature operation is independent of technology and band.

### 4.2.3 Test configuration selection for change in technology/band

The selection criteria for this measurement is, for a given antenna, to have DUT switch from a technology/band with lowest  $P_{limit}$  within the technology group (in case of multiple bands having the same  $P_{limit}$ , then select the band with highest *measured* 1gSAR at  $P_{limit}$ ) to a technology/band with highest  $P_{limit}$  within the technology group, in case of multiple bands having the same  $P_{limit}$ , then select the band with lowest *measured* 1gSAR at  $P_{limit}$  in Part 1 report, or vice versa.

This test is performed with the DUT's Tx power requested to be at maximum power, the technology/band switch is performed during Tx power enforcement duration (i.e., during the time when DUT is forced to have Tx power at  $P_{reserve}$ ).

### 4.2.4 Test configuration selection for change in antenna

The criteria to select a test configuration for antenna switch measurement is:

- Whenever possible and supported by the DUT, first select antenna switch configuration within the same technology/band (i.e., same technology and band combination).
- Then, select any technology/band that supports multiple Tx antennas, and has the highest difference in *P<sub>limit</sub>* among all supported antennas.
- In case of multiple bands having same difference in  $P_{limit}$  among supported antennas, then select the band having the highest *measured* 1gSAR at  $P_{limit}$  in Part 1 report.

This test is performed with the DUT's Tx power requested to be at maximum power in selected technology/band, and antenna change is conducted during Tx power enforcement duration (i.e., during the time when DUT is forced to have Tx power at  $P_{reserve}$ ).

### 4.2.5 Test configuration selection for change in DSI

The criteria to select a test configuration for DSI change test is

• Select a technology/band having the  $P_{limit} < P_{max}$  within any technology and DSI group, and for the same technology/band having a different  $P_{limit}$  in any other DSI group. Note that the selected DSI transition need to be supported by the device.

This test is performed with the DUT's Tx power requested to be at maximum power in selected technology/band, and DSI change is conducted during Tx power enforcement duration (i.e., during the time when DUT is forced to have Tx power at  $P_{reserve}$ ).

REV 1.0

#### 4.2.6 Test configuration selection for change in time window

FCC specifies different time window for time averaging based on operation frequency. The criteria to select a test configuration for validating Smart Transmit feature and demonstrating the compliance during the change in time window is

- Select any technology/band that has operation frequency classified in one time window defined by FCC (such as 100-seconds time window), and its corresponding  $P_{limit}$  is less than  $P_{max}$  if possible.
- Select the 2<sup>nd</sup> technology/band that has operation frequency classified in a different time window defined by FCC (such as 60-seconds time window), and its corresponding  $P_{limit}$  is less than  $P_{max}$  if possible.
- Note it is preferred both  $P_{limit}$  values of two selected technology/band less than corresponding  $P_{max}$ , but if not possible, at least one of technologies/bands has its  $P_{limit}$  less than  $P_{max}$ .

This test is performed with the EUT's Tx power requested to be at maximum power in selected technology/band. Test for one pair of time windows selected is sufficient as the feature operation is the same.

#### 4.2.7 Test configuration selection for SAR exposure switching

If supported, the test configuration for SAR exposure switching should cover

- 1. SAR exposure switch when two active radios are in the same time window
- 2. SAR exposure switch when two active radios are in different time windows. One test with two active radios in any two different time windows is sufficient as Smart Transmit operation is the same for RF exposure switch in any combination of two different time windows. For device supporting LTE + mmW NR, this test is covered in SAR vs PD exposure switch validation.

The Smart Transmit time averaging operation is independent of the source of SAR exposure (for example, LTE vs. Sub6 NR) and ensures total time-averaged RF exposure compliance. Hence, validation of Smart Transmit in any one simultaneous SAR transmission scenario (i.e., one combination for LTE + Sub6 NR transmission) is sufficient, where the SAR exposure varies among SAR<sub>radio1</sub> only, SAR<sub>radio2</sub>, and SAR<sub>radio2</sub> only scenarios.

The criteria to select a test configuration for validating Smart Transmit feature during SAR exposure switching scenarios is

- Select any two < 6GHz technologies/bands that the EUT supports simultaneous transmission (for example, LTE+Sub6 NR).
- Among all supported simultaneous transmission configurations, the selection order is
  - 1. select one configuration where both  $P_{limit}$  of radio1 and radio2 is less than their corresponding  $P_{max}$ , preferably, with different  $P_{limits}$ . If this configuration is not available, then,
  - 2. select one configuration that has  $P_{limit}$  less than its  $P_{max}$  for at least one radio. If this can not be found, then.
  - select one configuration that has  $P_{limit}$  of radio1 and radio2 greater than  $P_{max}$  but with least  $(P_{limit} - P_{max})$  delta.

Test for one simultaneous transmission scenario is sufficient as the feature operation is the same.

### 4.3 Test procedures for conducted power measurements

This section provides general conducted power measurement procedures to perform compliance test under dynamic transmission scenarios described in Section 3. In practice, an adjustment can be made in these procedures. The justification/clarification may be provided.

#### Time-varying Tx power transmission scenario 4.3.1

This test is performed with the two pre-defined test sequences described in Section 4.1 for all the technologies and bands selected in Section 4.2.1. The purpose of the test is to demonstrate the effectiveness of power limiting enforcement and that the time-averaged SAR (corresponding time-averaged Tx power) does not exceed the FCC limit at all times (see Eq. (1a) and (1b)).

### **Test procedure**

- 1. Measure  $P_{max}$ , measure  $P_{limit}$  and calculate  $P_{reserve}$  (= measured  $P_{limit}$  in dBm  $Reserve\_power\_margin$  in dB) and follow Section 4.1 to generate the test sequences for all the technologies and bands selected in Section 4.2.1. Both test sequence 1 and test sequence 2 are created based on measured  $P_{max}$  and measured  $P_{limit}$  of the DUT. Test condition to measure  $P_{max}$  and  $P_{limit}$  is:
  - a. Measure  $P_{max}$  with Smart Transmit disabled and callbox set to request maximum power.
  - Measure P<sub>limit</sub> with Smart Transmit enabled and Reserve power margin set to 0 dB, callbox set to request maximum power.
- 2. Set Reserve\_power\_margin to actual (intended) value (3dB for this DUT based on Part 1 report) and reset power on DUT to enable Smart Transmit, establish radio link in desired radio configuration, with callbox requesting the DUT's Tx power to be at pre-defined test sequence 1, measure and record Tx power versus time, and then convert the conducted Tx power into 1gSAR or 10gSAR value (see Eq. (1a)) using measured  $P_{limit}$  from above Step 1. Perform running time average to determine time-averaged power and 1qSAR or 10qSAR versus time as illustrated in Figure 4-1 where using 100-seconds time window as an example.

Note: In Eq.(1a), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the measured worst-case 1gSAR or 10gSAR value at Plimit for the corresponding technology/band/antenna/DSI reported in Part 1 report.

Note: For an easier computation of the running time average, 0 dBm can be added at the beginning of the test sequences the length of the responding time window, for example, add 0dBm for 100-seconds so the running time average can be directly performed starting with the first 100-seconds data using excel spreadsheet. This technique applies to all tests performed in this Part 2 report for easier time-averaged computation using excel spreadsheet.

Document S/N:	Test Dates:	DUT Type:		D 40 -4 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 13 of 91

Figure 4-1 **Running Average Illustration** 

- 3. Make one plot containing:
  - a. Instantaneous Tx power versus time measured in Step 2,
  - b. Requested Tx power used in Step 2 (test sequence 1),
  - c. Computed time-averaged power versus time determined in Step 2,
  - Time-averaged power limit (corresponding to FCC SAR limit of 1.6 W/kg for 1gSAR or 4.0W/kg for 10gSAR) given by

Time avearged power limit = meas. 
$$P_{limit} + 10 \times \log(\frac{FCC SAR \ limit}{meas.SAR \ Plimit})$$
 (5a)

where meas. Plimit and meas. SAR\_Plimit correspond to measured power at Plimit and measured SAR at Plimit.

- 4. Make another plot containing:
  - a. Computed time-averaged 1gSAR or 10gSAR versus time determined in Step 2
  - b. FCC 1gSAR<sub>limit</sub> of 1.6W/kg or FCC 10gSAR<sub>limit</sub> of 4.0W/kg.
- 5. Repeat Steps 2 ~ 4 for pre-defined test sequence 2 and replace the requested Tx power (test sequence 1) in Step 2 with test sequence 2.
- 6. Repeat Steps 2 ~ 5 for all the selected technologies and bands.
- 7. The validation criteria are, at all times, the time-averaged power versus time shown in Step 3 plot shall not exceed the time-averaged power limit (defined in Eq. (5a)), in turn, the time-averaged 1gSAR or 10gSAR versus time shown in Step 4 plot shall not exceed the FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR (i.e., Eq. (1b)).

### 4.3.2 Change in call scenario

This test is to demonstrate that Smart Transmit feature accurately accounts for the past Tx powers during time-averaging when a new call is established.

The call disconnects and re-establishment needs to be performed during power limit enforcement, i.e., when the DUT's Tx power is at Preserve level, to demonstrate the continuity of RF exposure management and limiting in call change scenario. In other words, the RF exposure averaged over any FCC defined time window (including the time windows containing the call change) does not exceed FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

REV 1.0

### Test procedure

- 1. Measure Plimit for the technology/band selected in Section 4.2.2. Measure Plimit with Smart Transmit enabled and Reserve power margin set to 0dB, callbox set to request maximum power.
- Set Reserve power margin to actual (intended) value and reset power on DUT to enable Smart Transmit.
- 3. Establish radio link with callbox in the selected technology/band.
- Request DUT's Tx power at 0 dBm for at least one time window specified for the selected technology/band, followed by requesting DUT's Tx power to be at maximum power for about ~60 seconds, and then drop the call for ~10 seconds. Afterwards, re-establish another call in the same radio configuration (i.e., same technology/band/channel) and continue callbox requesting DUT's Tx power to be at maximum power for the remaining time of at least another full duration of the specified time window. Measure and record Tx power versus time. Once the measurement is done, extract instantaneous Tx power versus time, convert the measured conducted Tx power into 1qSAR or 10gSAR value using Eq. (1a), and then perform the running time average to determine time-averaged power and 1gSAR or 10gSAR versus time.

NOTE: In Eq.(1a), instantaneous Tx power is converted into instantaneous 1qSAR or 10qSAR value by applying the measured worst-case 1gSAR or 10gSAR value at Plimit for the corresponding technology/band/antenna/DSI reported in Part 1 report.

- 5. Make one plot containing: (a) instantaneous Tx power versus time, (b) requested power, (c) computed time-averaged power, (d) time-averaged power limit calculated using Eq.(5a).
- 6. Make another plot containing: (a) computed time-averaged 1gSAR or 10gSAR versus time, and (b) FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

The validation criteria are, at all times, the time-averaged power versus time shall not exceed the timeaveraged power limit (defined in Eq.(5a)), in turn, the time-averaged 1gSAR or 10gSAR versus time shall not exceed the FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR (i.e., Eq. (1b)).

#### Change in technology and band 4.3.3

This test is to demonstrate the correct power control by Smart Transmit during technology switches and/or band handovers.

Similar to the change in call test in Section 4.3.2, to validate the continuity of RF exposure limiting during the transition, the technology and band handover needs to be performed when DUT's Tx power is at Preserve level (i.e., during Tx power enforcement) to make sure that the DUT's Tx power from previous  $P_{reserve}$  level to the new  $P_{reserve}$  level (corresponding to new technology/band). Since the  $P_{limit}$  could vary with technology and band, Eq. (1a) can be written as follows to convert the instantaneous Tx power in 1gSAR or 10gSAR exposure for the two given radios, respectively:

$$1g\_or\_10gSAR_1(t) = \frac{conducted\_Tx\_power\_1(t)}{conducted\_Tx\_power\_P_{limit\_1}} * 1g\_or\_10gSAR\_P_{limit\_1}$$
(6a)

$$1g\_or\_10gSAR_2(t) = \frac{conducted\_Tx\_power\_2(t)}{conducted\_Tx\_power\_P_{limit\_2}} * 1g\_or\_10gSAR\_P_{limit\_2}$$
 (6b)

$$\frac{1}{T_{SAR}} \left[ \int_{t-T_{SAR}}^{t_1} \frac{1g\_or\_10gSAR_1(t)}{FCC\ SAR\ limit} dt + \int_{t-T_{SAR}}^{t} \frac{1g\_or\_10gSAR_2(t)}{FCC\ SAR\ limit} dt \right] \le 1 \tag{6c}$$

where, conducted\_Tx\_power\_1(t), conducted\_Tx\_power\_Piimit\_1, and 1g\_or\_10gSAR\_Piimit\_1 correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at  $P_{limit}$ , and measured 1gSAR or 10gSAR value at Plimit of technology1/band1; conducted Tx power 2(t),

FCC ID: PY7-57441Y	PCTEST* Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by:  Quality Manager
Document S/N:	Test Dates:	DUT Type:		D 45 -4 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 15 of 91

conducted\_Tx\_power\_Plimit\_2(t), and 1g\_or\_10gSAR\_Plimit\_2 correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at Plimit, and measured 1gSAR or 10gSAR value at P<sub>limit</sub> of technology2/band2. Transition from technology1/band1 to the technology2/band2 happens at time-instant ' $t_1$ '.

### Test procedure

- 1. Measure P<sub>limit</sub> for both the technologies and bands selected in Section 4.2.3. Measure P<sub>limit</sub> with Smart Transmit enabled and Reserve power margin set to 0 dB, callbox set to request maximum power.
- 2. Set Reserve\_power\_margin to actual (intended) value and reset power on DUT to enable Smart Transmit
- 3. Establish radio link with callbox in first technology/band selected.
- Request DUT's Tx power at 0 dBm for at least one time window specified for the selected technology/band, followed by requesting DUT's Tx power to be at maximum power for about ~60 seconds, and then switch to second technology/band selected. Continue with callbox requesting DUT's Tx power to be at maximum power for the remaining time of at least another full duration of the specified time window. Measure and record Tx power versus time for the full duration of the test.
- 5. Once the measurement is done, extract instantaneous Tx power versus time, and convert the conducted Tx power into 1qSAR or 10qSAR value using Eq. (6a) and (6b) and corresponding measured P<sub>limit</sub> values from Step 1 of this section. Perform the running time average to determine time-averaged power and 1gSAR or 10gSAR versus time.
  - NOTE: In Eq.(6a) & (6b), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the measured worst-case 1qSAR or 10qSAR value at Plimit for the corresponding technology/band/antenna/DSI reported in Part 1 report.
- 6. Make one plot containing: (a) instantaneous Tx power versus time, (b) requested power, (c) computed time-averaged power, (d) time-averaged power limit calculated using Eq.(5a).
- 7. Make another plot containing: (a) computed time-averaged 1gSAR or 10gSAR versus time, and (b) FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

The validation criteria are, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed the FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR (i.e., Eq. (6c)).

#### 4.3.4 Change in antenna

This test is to demonstrate the correct power control by Smart Transmit during antenna switches from one antenna to another. The test procedure is identical to Section 4.3.3, by replacing technology/band switch operation with antenna switch. The validation criteria are, at all times, the time-averaged 1qSAR or 10gSAR versus time shall not exceed FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

NOTE: If the DUT does not support antenna switch within the same technology/band, but has multiple antennas to support different frequency bands, then the antenna switch test is included as part of change in technology and band (Section 4.3.3) test.

#### 4.3.5 Change in DSI

This test is to demonstrate the correct power control by Smart Transmit during DSI switches from one DSI to another. The test procedure is identical to Section 4.3.3, by replacing technology/band switch operation with DSI switch. The validation criteria are, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

Document S/N:	Test Dates:	DUT Type:		Dogo 46 of 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 16 of 91

#### 4.3.6 Change in time window

This test is to demonstrate the correct power control by Smart Transmit during the change in averaging time window when a specific band handover occurs. FCC specifies time-averaging windows of 100s for Tx frequency < 3GHz, and 60s for Tx frequency between 3GHz and 6GHz.

To validate the continuity of RF exposure limiting during the transition, the band handover test needs to be performed when EUT handovers from operation band less than 3GHz to greater than 3GHz and vice versa. The equations (3a) and (3b) in Section 2 can be written as follows for transmission scenario having change in time window,

$$1gSAR_{1}(t) = \frac{conducted\_Tx\_power\_1(t)}{conducted\_Tx\_power\_P_{limit\_1}} * 1g\_or 10g\_SAR\_P_{limit\_1}$$
(7a)

$$1gSAR_{2}(t) = \frac{conducted\_Tx\_power\_2(t)}{conducted\_Tx\_power\_P_{limit\_2}} * 1g\_or 10g\_SAR\_P_{limit\_2}$$
 (7b)

$$\frac{1}{T1_{SAR}} \left[ \int_{t-T1_{SAR}}^{t_1} \frac{1g\_or \ 10g\_SAR_1(t)}{FCC \ SAR \ limit} \, dt \right] + \frac{1}{T2_{SAR}} \left[ \int_{t-T2_{SAR}}^{t} \frac{1g_{or} \ 10g\_SAR_2(t)}{FCC \ SAR \ limit} \, dt \right] \leq 1 \tag{7c}$$

where, conducted\_Tx\_power\_1(t), conducted\_Tx\_power\_P\_limit\_1(t), and 1g\_ or 10g\_SAR\_P\_limit\_1 correspond to the instantaneous Tx power, conducted Tx power at Plimit, and compliance 1g\_ or 10g SAR values at P<sub>limit 1</sub> of band1 with time-averaging window 'T1<sub>SAR</sub>'; conducted Tx power 2(t), conducted\_Tx\_power\_P<sub>limit\_2</sub>(t), and 1g\_ or 10g\_SAR\_P<sub>limit\_2</sub> correspond to the instantaneous Tx power, conducted Tx power at Plimit, and compliance 1g\_ or 10g\_SAR values at Plimit\_2 of band2 with timeaveraging window 'T2<sub>SAR</sub>'. One of the two bands is less than 3GHz, another is greater than 3GHz. Transition from first band with time-averaging window 'T1<sub>SAR</sub>' to the second band with time-averaging window ' $T2_{SAR}$ ' happens at time-instant ' $t_1$ '.

### Test procedure

- 1. Measure P<sub>limit</sub> for both the technologies and bands selected in Section 4.2.6. Measure P<sub>limit</sub> with Smart Transmit enabled and Reserve power margin set to 0dB, callbox set to request maximum power.
- 2. Set Reserve\_power\_margin to actual (intended) value and enable Smart Transmit

### Transition from 100s time window to 60s time window, and vice versa

- 3. Establish radio link with callbox in the technology/band having 100s time window selected in Section 4.2.6.
- 4. Request EUT's Tx power to be at 0 dBm for at least 100 seconds, followed by requesting EUT's Tx power to be at maximum power for about ~140 seconds, and then switch to second technology/band (having 60s time window) selected in Section 4.2.6. Continue with callbox requesting EUT's Tx power to be at maximum power for about ~60s in this second technology/band, and then switch back to the first technology/band. Continue with callbox requesting EUT's Tx power to be at maximum power for at least another 100s. Measure and record Tx power versus time for the entire duration of the test.
- 5. Once the measurement is done, extract instantaneous Tx power versus time, and convert the conducted Tx power into 1gSAR or 10gSAR value (see Eq. (7a) and (7b)) using corresponding technology/band Step 1 result, and then perform 100s running average to determine time-averaged 1gSAR or 10gSAR versus time. Note that in Eq.(7a) & (7b), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the worst-case 1gSAR or 10gSAR value tested in Part 1 for the selected technologies/bands at Plimit.
- Make one plot containing: (a) instantaneous Tx power versus time measured in Step 4.
- 7. Make another plot containing: (a) instantaneous 1gSAR versus time determined in Step 5, (b) computed time-averaged 1gSAR versus time determined in Step 5, and (c) corresponding regulatory 1gSAR<sub>limit</sub> of 1.6W/kg or 10gSAR<sub>limit</sub> of 4.0W/kg.

© 2020 PCTEST				REV 1.

### Transition from 60s time window to 100s time window, and vice versa

- 8. Establish radio link with callbox in the technology/band having 60s time window selected in Section 4.2.6.
- Request EUT's Tx power to be at 0 dBm for at least 60 seconds, followed by requesting EUT's Tx power to be at maximum power for about ~80 seconds, and then switch to second technology/band (having 100s time window) selected in Section 4.2.6. Continue with callbox requesting EUT's Tx power to be at maximum power for about ~100s in this second technology/band, and then switch back to the first technology/band. Continue with callbox requesting EUT's Tx power to be at maximum power for the remaining time for a total test time of 500 seconds. Measure and record Tx power versus time for the entire duration of the test.
- 10. Repeat above Step 5~7 to generate the plots

The validation criteria is, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed the regulatory 1gSAR<sub>limit</sub> of 1.6W/kg or 10gSAR<sub>limit</sub> of 4.0W/kg.

#### SAR exposure switching 4.3.7

This test is to demonstrate that Smart Transmit feature is accurately accounts for switching in exposures among SAR from radio1 only, SAR from both radio1 and radio2, and SAR from radio2 only scenarios, and ensures total time-averaged RF exposure complies with the FCC limit. Here, radio1 represents primary radio (for example, LTE anchor in a NR non-standalone mode call) and radio2 represents secondary radio (for example, sub6 NR or mmW NR). The detailed test procedure for SAR exposure switching in the case of LTE+Sub6 NR non-standalone mode transmission scenario is provided in APPENDIX F:.

### Test procedure:

thereof, please contact INFO@PCTEST.COM.

- 1. Measure conducted Tx power corresponding to Plimit for radio1 and radio2 in selected band. Test condition to measure conducted Plimit is:
  - Establish device in call with the callbox for radio1 technology/band. Measure conducted Tx power corresponding to radio1  $P_{limit}$  with Smart Transmit enabled and Reserve power margin set to 0 dB, callbox set to request maximum power.
  - □ Repeat above step to measure conducted Tx power corresponding to radio2 *P<sub>limit</sub>*. If radio2 is dependent on radio1 (for example, non-standalone mode of Sub6 NR requiring radio1 LTE as anchor), then establish radio1 + radio2 call with callbox, and request all down bits for radio1 LTE. In this scenario, with callbox requesting maximum power from radio2 Sub6 NR, measured conducted Tx power corresponds to radio2 Plimit (as radio1 LTE is at all-down bits)
- 2. Set Reserve\_power\_margin to actual (intended) value, with EUT setup for radio1 + radio2 call. In this description, it is assumed that radio2 has lower priority than radio1. Establish device in radio1+radio2 call and request all-down bits or low power on radio1, with callbox requesting EUT's Tx power to be at maximum power in radio2 for at least one time window. After one time window, set callbox to request EUT's Tx power to be at maximum power on radio1, i.e., all-up bits. Continue radio1+radio2 call with both radios at maximum power for at least one time window and drop (or request all-down bits on) radio2. Continue radio1 at maximum power for at least one time window. Record the conducted Tx power for both radio1 and radio2 for the entire duration of this test.
- 3. Once the measurement is done, extract instantaneous Tx power versus time for both radio1 and radio2 links. Convert the conducted Tx power for both these radios into 1gSAR or 10gSAR value (see Eq. (6a) and (6b)) using corresponding technology/band  $P_{limit}$  measured in Step 1, and then perform the running time average to determine time-averaged 1gSAR or 10gSAR versus time.
- 4. Make one plot containing: (a) instantaneous Tx power versus time measured in Step 2.

© 2020 PCTEST				REV 1.

5. Make another plot containing: (a) instantaneous 1gSAR versus time determined in Step 3, (b) computed time-averaged 1gSAR versus time determined in Step 3, and (c) corresponding regulatory 1gSAR<sub>limit</sub> of 1.6W/kg or 10gSAR<sub>limit</sub> of 4.0W/kg.

The validation criteria is, at all times, the time-averaged 1gSAR or 10gSAR versus time shall not exceed the regulatory 1gSAR<sub>limit</sub> of 1.6W/kg or 10gSAR<sub>limit</sub> of 4.0W/kg.

### 4.4 Test procedure for time-varying SAR measurements

This section provides general time-varying SAR measurement procedures to perform compliance test under dynamic transmission scenarios described in Section 3. In practice, an adjustment can be made in these procedures. The justification/clarification may be provided.

To perform the validation through SAR measurement for transmission scenario 1 described in Section 3, the "path loss" between callbox antenna and DUT needs to be calibrated to ensure that the DUT Tx power reacts to the requested power from callbox in a radiated call. It should be noted that when signaling in closed loop mode, protocol-level power control is in play, resulting in DUT not solely following callbox TPC (Tx power control) commands. In other words, DUT response has many dependencies (RSSI, quality of signal, path loss variation, fading, etc.,) other than just TPC commands. These dependencies have less impact in conducted setup (as it is a controlled environment and the path loss can be very well calibrated) but have significant impact on radiated testing in an uncontrolled environment, such as SAR test setup. Therefore, the deviation in DUT Tx power from callbox requested power is expected, however the time-averaged SAR should not exceed FCC SAR requirement at all times as Smart Transmit controls Tx power at DUT.

The following steps are for time averaging feature validation through SAR measurement:

- 1. "Path Loss" calibration: Place the DUT against the phantom in the worst-case position determined based on Section 4.2.1. For each band selected, prior to SAR measurement, perform "path loss" calibration between callbox antenna and DUT. Since the SAR test environment is not controlled and well calibrated for OTA (Over the Air) test, extreme care needs to be taken to avoid the influence from reflections. The test setup is described in Section 6.2.
- 2. Time averaging feature validation:
  - For a given radio configuration (technology/band) selected in Section 4.2.1, enable Smart Transmit and set Reserve power margin to 0 dB, with callbox to request maximum power, perform area scan, conduct pointSAR measurement at peak location of the area scan. This point SAR value, pointSAR\_Plimit, corresponds to point SAR at the measured Plimit (i.e., measured Plimit from the DUT in Step 1 of Section 4.3.1).
  - Set Reserve power margin to actual (intended) value and reset power on DUT to enable Smart Transmit. Note, if Reserve\_power\_margin cannot be set wirelessly, care must be taken to reposition the DUT in the exact same position relative to the SAM phantom as in above Step 2.i. Establish radio link in desired radio configuration, with callbox requesting the DUT's Tx power at power levels described by test sequence 1 generated in Step 1 of Section 4.3.1, conduct point SAR measurement versus time at peak location of the area scan determined in Step 2.i of this section. Once the measurement is done, extract instantaneous point SAR vs time data, pointSAR(t), and convert it into instantaneous 1gSAR or 10gSAR vs. time using Eq. (3a), rewritten below:

$$1g\_or\_10gSAR(t) = \frac{pointSAR(t)}{pointSAR\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$

where, pointSAR P<sub>limit</sub> is the value determined in Step 2.i, and pointSAR(t) is the instantaneous point SAR measured in Step 2.ii,  $1g\_or\_10gSAR\_P_{limit}$  is the measured 1gSAR or 10gSAR value listed in Part 1 report.

#### 5 FCC MEASUREMENT PROCEDURES (FREQ > 6 GHZ)

This section provides the test plan and test procedures for validating Qualcomm Smart Transmit feature for mmW transmission. For this EUT, millimeter wave (mmW) transmission is only in non-standalone mode, i.e., it requires an LTE link as anchor.

#### 5.1 Test sequence for validation in mmW NR transmission

In 5G mmW NR transmission, the test sequence for validation is with the callbox requesting EUT's Tx power in 5G mmW NR at maximum power all the time.

#### 5.2 Test configuration selection criteria for validating Smart Transmit feature

## Test configuration selection for time-varying Tx power transmission

The Smart Transmit time averaging feature operation is independent of bands, modes, channels, and antenna configurations (beams) for a given technology. Hence, validation of Smart Transmit in any one band/mode/channel per technology is sufficient.

### Test configuration selection for change in antenna configuration (beam)

The Smart Transmit time averaging feature operation is independent of bands, modes, channels, and antenna configurations (beams) for a given technology. Hence, validation of Smart Transmit with beam switch between any two beams is sufficient.

# Test configuration selection for SAR vs. PD exposure switch during transmission

The Smart Transmit time averaging feature operation is independent of the nature of exposure (SAR vs. PD) and ensures total time-averaged RF exposure compliance. Hence, validation of Smart Transmit in any one band/mode/channel/beam for mmW + sub-6 (LTE) transmission is sufficient, where the exposure varies among SAR dominant scenario, SAR+PD scenario, and PD dominant scenario.

#### 5.3 Test procedures for mmW radiated power measurements

Perform conducted power measurement (for f < 6GHz) and radiated power measurement (for f > 6GHz) for LTE + mmW transmission to validate Smart Transmit time averaging feature in the various transmission scenarios described in Section 3.

This section provides general conducted power measurement procedures to perform compliance test under dynamic transmission scenarios described in Section 3. In practice, an adjustment can be made in these procedures. The justification/clarification may be provided.

#### Time-varying Tx power scenario 5.3.1

The purpose of the test is to demonstrate the effectiveness of power limiting enforcement and that the time-averaged Tx power when converted into RF exposure values does not exceed the FCC limit at all times (see Eq. (2a), (2b) & (2c) in Section 3).

### Test procedure:

Measure conducted Tx power corresponding to Plimit for LTE in selected band, and measure radiated Tx power corresponding to input.power.limit in desired mmW band/channel/beam by following below steps:

FCC ID: PY7-57441Y	PCTEST* Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by: Quality Manager
Document S/N:	Test Dates:	DUT Type:		Dogo 24 of 04

© 2020 PCTEST				REV 1.

**REV 1.0** 

- Measure radiated power corresponding to mmW input.power.limit by setting up the EUT's Tx power in desired band/channel/beam at input.power.limit in Factory Test Mode (FTM). This test is performed in a calibrated anechoic chamber. Rotate the EUT to obtain maximum radiated Tx power, keep the EUT in this position and do not disturb the position of the EUT inside the anechoic chamber for the rest of this test.
- Reset EUT to place in online mode and establish radio link in LTE, measure conducted Tx power corresponding to LTE Plimit with Smart Transmit enabled and Reserve\_power\_margin set to 0 dB, callbox set to request maximum power.
- 2. Set Reserve power margin to actual (intended) value and reset power on EUT to enable Smart Transmit. With EUT setup for a mmW NR call in the desired/selected LTE band and mmW NR band, perform the following steps:
  - Establish LTE and mmW NR connection in desired band/channel/beam used in Step 1. As soon as the mmW connection is established, immediately request all-down bits on LTE link. With callbox requesting EUT's Tx power to be at maximum mmW power to test predominantly PD exposure scenario (as SAR exposure is less when LTE's Tx power is at low power).
  - b. After 120s, request LTE to go all-up bits for at least 100s. SAR exposure is dominant. There are two scenarios:
    - If  $P_{limit} < P_{max}$  for LTE, then the RF exposure margin (provided to mmW NR) gradually runs out (due to high SAR exposure). This results in gradual reduction in the 5G mmW NR transmission power and eventually seized 5G mmW NR transmission when LTE goes to Preserve level.
    - If  $P_{limit} \ge P_{max}$  for LTE, then the 5G mmW NR transmission's averaged power should gradually reduce but the mmW NR connection can sustain all the time (assuming TxAGC uncertainty = 0dB).
  - Record the conducted Tx power of LTE and radiated Tx power of mmW for the full duration of this test of at least 300s.
- Once the measurement is done, extract instantaneous Tx power versus time for both LTE and mmW links. Convert the conducted Tx power for LTE into 1qSAR or 10qSAR value using Eq. (2a) and  $P_{limit}$ measured in Step 1.b, and then divide by FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR to obtain instantaneous normalized 1gSAR or 10gSAR versus time. Perform 100s running average to determine normalized 100s-averaged 1gSAR or 10gSAR versus time.
  - NOTE: In Eq.(2a), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the measured worst-case 1gSAR or 10gSAR value at Plimit for the corresponding technology/band/antenna/DSI reported in Part 1 report.
- 4. Similarly, convert the radiated Tx power for mmW into 4cm<sup>2</sup>PD value using Eq. (2b) and the radiated Tx power limit (i.e., radiated Tx power at input.power.limit) measured in Step 1.a, then divide by FCC 4cm<sup>2</sup>PD limit of 10W/m<sup>2</sup> to obtain instantaneous normalized 4cm<sup>2</sup>PD versus time. Perform 4s running average to determine normalized 4s-averaged 4cm<sup>2</sup>PD versus time.
  - NOTE: In Eq.(2b), instantaneous radiated Tx power is converted into instantaneous 4cm<sup>2</sup>PD by applying the worst-case 4cm<sup>2</sup>PD value measured at input power.limit for the selected band/beam in Part 1 report.
- 5. Make one plot containing: (a) instantaneous conducted Tx power for LTE versus time, (b) computed 100s-averaged conducted Tx power for LTE versus time, (c) instantaneous radiated Tx power for

FCC ID: PY7-57441Y	Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by: Quality Manager
Document S/N:	Test Dates:	DUT Type:		Dogo 22 of 04

mmW versus time, as measured in Step 2, (d) computed 4s-averaged radiated Tx power for mmW versus time, and (e) time-averaged conducted and radiated power limits for LTE and mmW radio using Eq. (5a) & (5b), respectively:

Time avearged LTE power limit = meas. 
$$P_{limit} + 10 \times \log(\frac{FCC \, SAR \, limit}{meas. SAR \, Plimit})$$
 (5a)

$$\textit{Time avearged mmW NR power limit} = \textit{meas.EIRP}_{\textit{input.power.limit}} + 10 \times \log(\frac{\textit{FCC PD limit}}{\textit{meas.PD\_input.power.limit}}) \tag{5b}$$

where meas. EIRP<sub>invut.nower.limit</sub> and meas. PD\_input. power. limit correspond to measured EIRP at input.power.limit and measured power density at input.power.limit.

Make another plot containing: (a) computed normalized 100s-averaged 1gSAR or 10gSAR versus time determined in Step 3, (b) computed normalized 4s-averaged 4cm<sup>2</sup>PD versus time determined in Step 4, and (c) corresponding total normalized time-averaged RF exposure (sum of steps (6.a) and (6.b)) versus time.

The validation criteria are, at all times, the total normalized time-averaged RF exposure versus time determined in Step 6.c shall not exceed the normalized limit of 1.0 of FCC requirement (i.e., Eq. (2c)).

# 5.3.2 Switch in SAR vs. PD exposure during transmission

This test is to demonstrate that Smart Transmit feature is independent of the nature of exposure (SAR vs. PD), accurately accounts for switching in exposures among SAR dominant, SAR+PD, and PD dominant scenarios, and ensures total time-averaged RF exposure compliance.

### **Test procedure:**

- 1. Measure conducted Tx power corresponding to  $P_{limit}$  for LTE in selected band, and measure radiated Tx power corresponding to input.power.limit in desired mmW band/channel/beam by following below steps:
  - Measure radiated power corresponding to input.power.limit by setting up the EUT's Tx power a. in desired band/channel/beam at input.power.limit in FTM. This test is performed in a calibrated anechoic chamber. Rotate the EUT to obtain maximum radiated Tx power, keep the EUT in this position and do not disturb the position of the EUT inside the anechoic chamber for the rest of this test.
  - Reset EUT to place in online mode and establish radio link in LTE, measure conducted Tx h. power corresponding to LTE Plimit with Smart Transmit enabled and Reserve\_power\_margin set to 0 dB, callbox set to request maximum power.
- 2. Set Reserve power margin to actual (intended) value and reset power in EUT, with EUT setup for LTE + mmW call, perform the following steps:
  - Establish LTE (sub-6) and mmW NR connection with callbox.
  - As soon as the mmW connection is established, immediately request all-down bits on LTE link. Continue LTE (all-down bits) + mmW transmission for more than 100s duration to test predominantly PD exposure scenario (as SAR exposure is negligible from all-down bits in LTE).
  - After 120s, request LTE to go all-up bits, mmW transmission should gradually run out of RF exposure margin if LTE's  $P_{limit} < P_{max}$  and seize mmW transmission (SAR only scenario); or mmW transmission should gradually reduce in Tx power and will sustain the connection if LTE's  $P_{limit} > P_{max}$ .
  - d. After 40s, request LTE to go all-down bits, mmW transmission should start getting back RF exposure margin and resume transmission again.

- e. Record the conducted Tx power of LTE and radiated Tx power of mmW for the entire duration of this test of at least 300s.
- 3. Once the measurement is done, extract instantaneous Tx power versus time for both LTE and mmW links. Convert the conducted Tx power for LTE into 1gSAR or 10gSAR value using Eq. (2a) and Plimit measured in Step 1.b, and then divide by FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR to obtain instantaneous normalized 1gSAR or 10gSAR versus time. Perform 100s running average to determine normalized 100s-averaged 1gSAR or 10gSAR versus time.
  - NOTE: In Eq.(2a), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the measured worst-case 1gSAR or 10gSAR value at *Plimit* for the corresponding technology/band/antenna/DSI reported in Part 1 report.
- 4. Similarly, convert the radiated Tx power for mmW into 4cm<sup>2</sup>PD value using Eq. (2b) and the radiated Tx power limit (i.e., radiated Tx power at *input.power.limit*) measured in Step 1.a, then divide this by FCC 4cm<sup>2</sup>PD limit of 10W/m<sup>2</sup> to obtain instantaneous normalized 4cm<sup>2</sup>PD versus time. Perform 4s running average to determine normalized 4s-averaged 4cm<sup>2</sup>PD versus time.
  - NOTE: In Eq.(2b), instantaneous radiated Tx power is converted into instantaneous 4cm<sup>2</sup>PD by applying the worst-case 4cm<sup>2</sup>PD value measured at *input.power.limit* for the selected band/beam in Part 1 report.
- 5. Make one plot containing: (a) instantaneous conducted Tx power for LTE versus time, (b) computed 100s-averaged conducted Tx power for LTE versus time, (c) instantaneous radiated Tx power for mmW versus time, as measured in Step 2, (d) computed 4s-averaged radiated Tx power for mmW versus time, and (e) time-averaged conducted and radiated power limits for LTE and mmW radio using Eq. (5a) & (5b), respectively.
- 6. Make another plot containing: (a) computed normalized 100s-averaged 1gSAR or 10gSAR versus time determined in Step 3, (b) computed normalized 4s-averaged 4cm<sup>2</sup>PD versus time determined in Step 4, and (c) corresponding total normalized time-averaged RF exposure (sum of steps (6.a) and (6.b)) versus time.

The validation criteria are, at all times, the total normalized time-averaged RF exposure versus time determined in Step 6.c shall not exceed the normalized limit of 1.0 of FCC requirement (i.e., Eq. (2c)).

# 5.3.3 Change in antenna configuration (beam)

This test is to demonstrate the correct power control by Smart Transmit during changes in antenna configuration (beam). Since the *input.power.limit* varies with beam, the Eq. (2a), (2b) and (2c) in Section 3 are written as below for transmission scenario having change in beam,

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
(8a)

$$4cm^{2}PD_{1}(t) = \frac{radiated\_Tx\_power\_1(t)}{radiated\_Tx\_power\_input.power.limit\_1} * 4cm^{2}PD\_input.power.limit\_1$$
 (8b)

$$4cm^{2}PD_{2}(t) = \frac{radiated\_Tx\_power\_2(t)}{radiated\_Tx\_power\_input.power.limit\_2} * 4cm^{2}PD\_input.power.limit\_2$$
 (8c)

	$\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)$	$\frac{1}{1} \frac{1}{T_{PD}} \left[ \int_{t-T_{PD}}^{t_1} 4cm^2 PD_1(t) dt + \int_{t_1}^{t} 4cm^2 PD_1(t) dt \right]$	$\frac{u^2 \text{PD}_2(t) dt}{} < 1 $	3d)
	FCC SAR limit	FCC4cm <sup>2</sup> PD limit	21 (	<i></i>

CTEST REV1

where,  $conducted\_Tx\_power(t)$ ,  $conducted\_Tx\_power\_P_{limit}$ , and  $1g\_or\_10gSAR\_P_{limit}$  correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at Plimit, and measured 1gSAR or 10gSAR values at Plimit corresponding to LTE transmission. Similarly, radiated\_Tx\_power\_1(t), radiated Tx power input.power.limit 1, and 4cm<sup>2</sup>PD input.power.limit 1 correspond to the measured instantaneous radiated Tx power, radiated Tx power at input.power.limit, and 4cm<sup>2</sup>PD value at input.power.limit of beam 1; radiated\_Tx\_power\_2(t), radiated\_Tx\_power\_input.power.limit\_2, and 4cm<sup>2</sup>PD input.power.limit 2 correspond to the measured instantaneous radiated Tx power, radiated Tx power at input.power.limit, and 4cm<sup>2</sup>PD value at input.power.limit of beam 2 corresponding to mmW transmission.

### Test procedure:

- 1. Measure conducted Tx power corresponding to Plimit for LTE in selected band, and measure radiated Tx power corresponding to input.power.limit in desired mmW band/channel/beam by following below steps:
  - a. Measure radiated power corresponding to mmW input.power.limit by setting up the EUT's Tx power in desired band/channel at *input.power.limit* of beam 1 in FTM. Do not disturb the position of the EUT inside the anechoic chamber for the rest of this test. Repeat this Step 1.a for beam 2.
  - b. Reset EUT to place in online mode and establish radio link in LTE, measure conducted Tx power corresponding to LTE Plimit with Smart Transmit enabled and Reserve\_power\_margin set to 0 dB, callbox set to request maximum power.
- 2. Set Reserve\_power\_margin to actual (intended) value and reset power in EUT, With EUT setup for LTE + mmW connection, perform the following steps:
  - Establish LTE (sub-6) and mmW NR connection in beam 1. As soon as the mmW connection is established, immediately request all-down bits on LTE link with the callbox requesting EUT's Tx power to be at maximum mmW power.
  - b. After beam 1 continues transmission for at least 20s, request the EUT to change from beam 1 to beam 2, and continue transmitting with beam 2 for at least 20s.
  - Record the conducted Tx power of LTE and radiated Tx power of mmW for the entire duration of this test.
- Once the measurement is done, extract instantaneous Tx power versus time for both LTE and mmW links. Convert the conducted Tx power for LTE into 1qSAR or 10qSAR value using the similar approach described in Step 3 of Section 5.3.2. Perform 100s running average to determine normalized 100s-averaged 1gSAR versus time.
- 4. Similarly, convert the radiated Tx power for mmW NR into 4cm<sup>2</sup>PD value using Eq. (8b), (8c) and the radiated Tx power limits (i.e., radiated Tx power at input.power.limit) measured in Step 1.a for beam 1 and beam 2, respectively, and then divide the resulted PD values by FCC 4cm<sup>2</sup>PD limit of 10W/m<sup>2</sup> to obtain instantaneous normalized 4cm<sup>2</sup>PD versus time for beam 1 and beam 2. Perform 4s running average to determine normalized 4s-averaged 4cm<sup>2</sup>PD versus time.
  - NOTE: In Eq.(8b) and (8c), instantaneous radiated Tx power of beam 1 and beam 2 is converted into instantaneous 4cm<sup>2</sup>PD by applying the worst-case 4cm<sup>2</sup>PD value measured at the input.power.limit of beam 1 and beam 2 in Part 1 report, respectively.
- 5. Since the measured radiated powers for beam 1 and beam 2 in Step 1.a were performed at an arbitrary rotation of EUT in anechoic chamber, repeat Step 1.a of this procedure by rotating the EUT to determine maximum radiated power at *input.power.limit* in FTM mode for both beams separately.

FCC ID: PY7-57441Y	PCTEST* Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by: Quality Manager
Document S/N:	Test Dates:	DUT Type:		D 05 -4 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 25 of 91

Re-scale the measured instantaneous radiated power in Step 2.c by the delta in radiated power measured in Step 5 and the radiated power measured in Step 1.a for plotting purposes in next Step. In other words, this step essentially converts measured instantaneous radiated power during the measurement in Step 2 into maximum instantaneous radiated power for both beams. Perform 4s running average to compute 4s-avearged radiated Tx power, Additionally, use these EIRP values measured at input.power.limit at respective peak locations to determine the EIRP limits (using Eq. (5b)) for both these beams.

- 6. Make one plot containing: (a) instantaneous conducted Tx power for LTE versus time, (b) computed 100s-averaged conducted Tx power for LTE versus time, (c) instantaneous radiated Tx power for mmW versus time, as obtained in Step 5, (d) computed 4s-averaged radiated Tx power for mmW versus time, as obtained in Step 5, and (e) time-averaged conducted and radiated power limits for LTE and mmW radio, respectively.
- 7. Make another plot containing: (a) computed normalized 100s-averaged 1gSAR versus time determined in Step 3, (b) computed normalized 4s-averaged 4cm<sup>2</sup>PD versus time determined in Step 4, and (c) corresponding total normalized time-averaged RF exposure (sum of steps (6.a) and (6.b)) versus time.

The validation criteria are, at all times, the total normalized time-averaged RF exposure versus time determined in Step 6.c shall not exceed the normalized limit of 1.0 of FCC requirement (i.e., (8d)).

#### 5.4 Test procedure for time-varying PD measurements

The following steps are used to perform the validation through PD measurement for transmission scenario 1 described in Section 3:

- 1. Place the EUT on the cDASY6 platform to perform PD measurement in the worst-case position/surface for the selected mmW band/beam. In PD measurement, the callbox is set to request maximum Tx power from EUT all the time. Hence, "path loss" calibration between callbox antenna and EUT is not needed in this test.
- 2. Time averaging feature validation:
  - Measure conducted Tx power corresponding to Plimit for LTE in selected band, and measure point E-field corresponding to input.power.limit in desired mmW band/channel/beam by following the below steps:
    - i. Measure conducted Tx power corresponding to LTE Plimit with Smart Transmit enabled and Reserve\_power\_margin set to 0 dB, with callbox set to request maximum power.
    - ii. Measure point E-field at peak location of fast area scan corresponding to input.power.limit by setting up the EUT's Tx power in desired mmW band/channel/beam at input.power.limit in FTM. Do not disturb the position of EUT and mmW cDASY6 probe.
  - Set Reserve power margin to actual value (i.e., intended value) and reset power on EUT, place EUT in online mode. With EUT setup for LTE (sub-6) + mmW NR call, as soon as the mmW NR connection is established, request all-down bits on LTE link. Continue LTE (all-down bits) + mmW transmission for more than 100s duration to test predominantly PD exposure scenario. After 120s, request LTE to go all-up bits, mmW transmission should gradually reduce. Simultaneously, record the conducted Tx power of LTE transmission using power meter and point E-field (in terms of ratio of  $\frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2}$ ) of mmW transmission using cDASY6 E-field probe at peak location identified in Step 2.a.ii for the entire duration of this test of at least 300s.
  - Once the measurement is done, extract instantaneous conducted Tx power versus time for LTE transmission and  $\frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2}$  ratio versus time from cDASY6 system for mmW

FCC ID: PY7-57441Y	PCTEST* Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by: Quality Manager

transmission. Convert the conducted Tx power for LTE into 1gSAR or 10gSAR value using Eq. (4a) and  $P_{limit}$  measured in Step 2.a.i. and then divide this by FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR to obtain instantaneous normalized 1gSAR or 10gSAR versus time. Perform 100s running average to determine normalized 100s-averaged 1gSAR or 10gSAR versus time

NOTE: In Eq.(4a), instantaneous Tx power is converted into instantaneous 1gSAR or 10gSAR value by applying the measured worst-case 1gSAR or 10gSAR value at Plimit for the corresponding technology/band reported in Part 1 report.

- d. Similarly, convert the point E-field for mmW transmission into 4cm<sup>2</sup>PD value using Eq. (4b) and radiated power limit measured in Step 2.a.ii, and then divide this by FCC 4cm<sup>2</sup>PD limit of 10W/m<sup>2</sup> to obtain instantaneous normalized 4cm<sup>2</sup>PD versus time. Perform 4s running average to determine normalized 4s-averaged 4cm<sup>2</sup>PD versus time.
- Make one plot containing: (i) computed normalized 100s-averaged 1gSAR or 10gSAR versus time determined in Step 2.c, (ii) computed normalized 4s-averaged 4cm<sup>2</sup>PD versus time determined in Step 2.d. and (iii) corresponding total normalized time-averaged RF exposure (sum of steps (2.e.i) and (2.e.ii)) versus time.

The validation criteria are, at all times, the total normalized time-averaged RF exposure versus time determined in Step 2.e.iii shall not exceed the normalized limit of 1.0 of FCC requirement (i.e., Eq. (4c)).

# **Conducted Measurement Test setup**

### Legacy Test Setup

The Rohde & Schwarz CMW500 callbox was used in this test. The test setup schematic is shown in Figure 6-1a (Appendix D - Test Setup Photo 1) for measurements with a single antenna of DUT, and in Figure 6-1b (Appendix D - Test Setup Photo 2) for measurements involving antenna switch. For single antenna measurement, one port (RF1 COM) of the callbox is connected to the RF port of the DUT using a directional coupler. For technology/band switch measurement, one port (RF1 COM) of the callbox used for signaling two different technologies is connected to a combiner, which is in turn connected to a directional coupler. The other end of the directional coupler is connected to a splitter to connect to two RF ports of the DUT corresponding to the two antennas of interest. In the setups, power meter is used to tap the directional coupler for measuring the conducted output power of the DUT. For all legacy conducted tests, only RF1 COM port of the callbox is used to communicate with the DUT.

Note that for this EUT, antenna switch test is included within time-window switch test as the selected technology/band combinations for the time-window switch test are on two different antennas

All the path losses from RF port of DUT to the callbox RF COM port and to the power meter are calibrated and automatically entered as offsets in the callbox and the power meter via test scripts on the PC used to control callbox and power meter.

#### LTE+Sub6 NR test setup:

LTE conducted port and Sub6 NR conducted port are same on this EUT (i.e., they share the same antenna), therefore, low-/high-pass filter are used to separate LTE and Sub6 NR signals for power meter measurement via directional couplers, as shown in below Figure 6-1c (Appendix D – Test Setup Photo 3).

All the path losses from RF port of DUT to the callbox RF COM port and to the power meter are calibrated and automatically entered as offsets in the callbox and the power meter via test scripts on the PC used to control callbox and power meter.

(b) Appendix D – Test Setup Photo 2

Figure 6-1 Conducted power measurement setup

Both the callbox and power meter are connected to the PC using GPIB cables. Two test scripts are custom made for automation, and the test duration set in the test scripts is 500 seconds.

For time-varying Tx power measurement, the PC runs the 1st test script to send GPIB commands to control the callbox's requested power versus time, while at the same time to record the conducted power measured at DUT RF port using the power meter. The commands sent to the callbox to request power are:

- 0dBm for 100 seconds
- test sequence 1 or test sequence 2 (defined in Section 4.1 and generated in Section 4.2.1), for 360 seconds
- stay at the last power level of test sequence 1 or test sequence 2 for the remaining time.

Power meter readings are periodically recorded every 100ms. A running average of this measured Tx power over 100 seconds is performed in the post-data processing to determine the 100s-time averaged power.

For call drop, technology/band/antenna switch, and DSI switch tests, after the call is established, the callbox is set to request the DUT's Tx power at 0dBm for 100 seconds while simultaneously starting the

REV 1.0 04/06/2020

 $2^{\text{nd}}$  test script runs at the same time to start recording the Tx power measured at DUT RF port using the power meter. After the initial 100 seconds since starting the Tx power recording, the callbox is set to request maximum power from the DUT for the rest of the test. Note that the call drop/re-establish, or technology/band/antenna switch or DSI switch is manually performed when the Tx power of DUT is at  $P_{\text{reserve}}$  level. See Section 4.3 for detailed test procedure of call drop test, technology/band/antenna switch test and DSI switch test.

### 6.2 SAR Measurement setup

The measurement setup is similar to normal SAR measurements as described in the Part 1 Test Report. The difference in SAR measurement setup for time averaging feature validation is that the callbox is signaling in close loop power control mode (instead of requesting maximum power in open loop control mode) and callbox is connected to the PC using GPIB so that the test script executed on PC can send GPIB commands to control the callbox's requested power over time (test sequence). The same test script used in conducted setup for time-varying Tx power measurements is also used in this section for running the test sequences during SAR measurements, and the recorded values from the disconnected power meter by the test script were discarded.

As mentioned in Section 4.4, for DUT to follow TPC command sent from the callbox wirelessly, the "path loss" between callbox antenna and the DUT needs to be very well calibrated. Since the SAR chamber is in uncontrolled environment, precautions must be taken to minimize the environmental influences on "path loss". Similarly, in the case of time-varying SAR measurements in Sub6 NR (with LTE as anchor), "path loss" between callbox antenna and the EUT needs to be carefully calibrated for both LTE link as well as for Sub6 NR link.

The DUT is placed in worst-case position according to Table 8-2.

TEST REV 1.0

# 7.1 Radiated Power Measurement Test setup

The Keysight Technologies E7515B UXM callbox is used in this test. The schematic of the setup is shown in Figure 7-1. The UXM callbox has two RF radio heads to up/down convert IF to mmW frequencies, which in turn are connected to two horn antennas for V- and H-polarizations for downlink communication. In the uplink, a directional coupler is used in the path of one of the horn antennas to measure and record radiated power using a Rohde & Schwarz NRP50S power sensor. Note here that the isolation of the directional coupler may not be sufficient to attenuate the downlink signal from the callbox, which will result in high noise floor masking the recording of radiated power from EUT. In that case, either lower the downlink signal strength emanating from the RF radio heads of callbox or add an attenuator between callbox radio heads and directional coupler. Additionally, note that since the measurements performed in this validation are all relative, measurement of EUT's radiated power in one polarization is sufficient. The EUT is placed inside an anechoic chamber with V- and H-pol horn antennas to establish the radio link as shown in Figure 7-1. The callbox's LTE port is directly connected to the EUT's RF port via a directional coupler to measure the EUT's conducted Tx power using a Rohde & Schwarz NRP8S power sensor. Additionally, EUT is connected to the PC via USB connection for sending beam switch command. Care is taken to route the USB cable and RF cable (for LTE connection) away from the EUT's mmW antenna modules.

Setup in Figure 7-1 is used for the test scenario 1, 5 and 6 described in Section 3. The test procedures described in Section 5 are followed. The path losses from the EUT to both the power meters are calibrated and used as offset in the power meter.

Figure 7-1 mmW NR radiated power measurement setup – Test Setup Photo 7

Both the callbox and power meters are connected to the PC using USB cables. Test scripts are custom made for automation of establishing LTE + mmW call, conducted Tx power recording for LTE and radiated Tx power recording for mmW. These tests are manually stopped after desired time duration. Test script is programmed to set LTE Tx power to all-down bits on the callbox immediately after the mmW link is established, and programmed to set toggle between all-up and all-down bits depending on the transmission scenario being evaluated. Similarly, test script is also programmed to send beam switch command manually to the EUT via USB connection. For all the tests, the callbox is set to request maximum Tx power in mmW NR radio from EUT all the time.

Test configurations for this validation are detailed in Section 5.2. Test procedures are listed in Section 5.3.

04/06/2020

### 7.2 Power Density Measurement Test setup

The measurement setup is similar to normal PD measurements, the EUT is positioned on cDASY6 platform, and is connected with the callbox (conducted for LTE and wirelessly for mmW). Keysight UXM callbox is set to request maximum mmW Tx power from EUT all the time. Hence, "path loss" calibration between callbox antenna and EUT is not needed in this test. The callbox's LTE port is directly connected to the EUT's RF port via a directional coupler to measure the EUT's conducted Tx power using a Rohde & Schwarz NRP8S power sensor. Additionally, EUT is connected to the PC via USB connection for toggling between FTM and online mode with Smart Transmit enabled following the test procedures described Section 5.4.

Worst-surface of EUT (for the mmW beam being tested) is positioned facing up for PD measurement with cDASY6 mmW probe. Figure 7-2 shows the schematic of this measurement setup.

Figure 7-2 Power Density Measurement Setup - Test Setup Photo 6

Both callbox and power meters are connected to the PC using USB cables. Test scripts are custom made for automation of establishing LTE + mmW call, and for conducted Tx power recording of LTE transmission. These tests are manually stopped after desired time duration. Once the mmW link is established. LTE Tx power is programmed to toggle between all-up and all-down bits on the callbox. For all the tests, the callbox is set to request maximum Tx power in mmW NR radio from EUT all the time. Therefore, the calibration for the pathloss between the EUT and the horn antenna connected to the remote radio head of the callbox is not required.

Power meter readings are periodically recorded every 10ms on NR8S power sensor for LTE conducted Tx power. Time-averaged E-field measurements are performed using EUmmWV3 mmW probe at peak location of fast area scan. The distance between EUmmWV3 mmW probe tip to EUT surface is ~0.5 mm. and the distance between EUmmWV3 mmW probe sensor to probe tip is 1.5 mm. cDASY6 records  $[pointE(t)]^2$ relative point E-field (i.e., ratio  $\frac{|pointE(t)|^2}{[pointE\_input.power.limit]^2}$ ) versus time for mmW NR transmission.

### WWAN (sub-6) transmission

The P<sub>limit</sub> values, corresponding to 1.0 W/kg (1gSAR) and 2.5 W/kg (10gSAR) of SAR design target, for technologies and bands supported by DUT are derived in Part 0 report and summarized in Table 8-1. Note all Plimit power levels entered in Table 8-1 correspond to average power levels after accounting for duty cycle in the case of TDD modulation schemes.

Table 8-1 Plimit for supported technologies and bands (Plimit in EFS file)

Exposure Scenario:		Body-Worn	Phablet	Head	Hotspot

NR FDD n2	1		16.0		

<sup>\*</sup> Maximum tune up target power,  $P_{max}$ , is configured in NV settings in DUT to limit maximum transmitting power. This power is converted into peak power in NV settings for TDD schemes. The DUT maximum allowed output power is equal to  $P_{max}$  + 1 dB device uncertainty.

Based on selection criteria described in Section 4.2.1, the selected technologies/bands for testing timevarying test sequences are highlighted in yellow in Table 8-1. Per the manufacturer, the Reserve\_power\_margin (dB) is set to 3dB in EFS and is used in Part 2 test.

The radio configurations used in Part 2 test for selected technologies, bands, DSIs and antennas are listed in Table 8-2. The corresponding worst-case radio configuration 1gSAR or 10gSAR values for selected technology/band/DSI are extracted from Part 1 report and are listed in the last column of Table 8-2.

Based on equations (1a), (2a), (3a) and (4a), it is clear that Part 2 testing outcome is normalized quantity, which implies that it can be applied to any radio configuration within a selected technology/band/DSI.

FCC ID: PY7-57441Y	Proud to be part of element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by:  Quality Manager
Document S/N:	Test Dates:	DUT Type:		Dama 22 of 04

© 2020 PCTEST				REV 1.0

Thus, as long as applying the worst-case SAR obtained from the worst radio configuration in Part 1 testing to calculate time-varying SAR exposure in equations (1a), (2a), (3a) and (4a), the accuracy in compliance demonstration remains the same. Therefore, there may be some differences between the radio configuration selected for Part 2 testing and the radio configuration associated with worst-case SAR obtained in the Part 1 evaluation.

Table 8-2 Radio configurations selected for Part 2 test

Note that: DSI = 5 represents the head exposure, body worn exposure at 10mm spacing, and extremity exposure at 0mm spacing; similarly, the hotspot exposure is distinguished via hotspot mode, represented as DSI = 6; DSI = 2 represents all other exposures which cannot be distinguished, in this case, max power; the maximum 1gSAR and/or 10gSAR among all remaining exposure scenarios or the minimum *Plimit* among all remaining exposure is used in Smart Transmit feature for time averaging operation.

Based on the selection criteria described in Section 4.2, the radio configurations for the Tx varying transmission test cases listed in Section 3 are:

- Technologies and bands for time-varying Tx power transmission: The test case 1~5 listed in Table 8-2 are selected to test with the test sequences defined in Section 4.1 in both time-varying conducted power measurement and time-varying SAR measurement.
- 2. Technology and band for change in call test: LTE Band 48, having the lowest Plimit among all technologies and bands (test case 6 in Table 8-2), is selected for performing the call drop test in conducted power setup.
- 3. Technologies and bands for change in technology/band test: Following the guidelines in Section 4.2.3, test case 7 in Table 8-2 is selected for handover test from a technology/band within one technology group (LTE Band 48, DSI=6, antenna 2), to a technology/band in the same DSI within another technology group (UMTS Band 2, DSI=6, antenna 1) in conducted power setup.
- Technologies and bands for change in DSI: Based on selection criteria in Section 4.2.5, for a given technology and band, test case 9 in Table 8-2 is selected for DSI switch test by establishing a call in LTE Band 25 in DSI = 5, and then handing over to DSI = 6 exposure scenario in conducted power setup.

FCC ID: PY7-57441Y	PCTEST* Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by: Quality Manager
Document S/N:	Test Dates:	DUT Type:		Dogo 24 of 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 34 of 91

- 5. <u>Technologies and bands for change in time-window/antenna</u>: Based on selection criteria in Section 4.2.6, for a given DSI=6, test case 8 in Table 8-2 is selected for time window switch between 60s window (LTE 48, Antenna 2) and 100s window (LTE 25, Antenna 1) in conducted power setup.
- 6. Technologies and bands for switch in SAR exposure: Based on selection criteria in Section 4.2.7 Scenario 1, test case 10 in Table 8-2 is selected for SAR exposure switching test in one of the supported simultaneous WWAN transmission scenario, i.e., LTE + Sub6 NR active in the same 100s time window, in conducted power setup. Since this device supports LTE + mmW NR, test for Section 4.2.7 Scenario 2 for RF exposure switch is covered in Sections 13.1 and 13.2 between LTE (100s window) and mmW NR (4s window).

### 8.2 Plimit and Pmax measurement results

The measured  $P_{limit}$  for all the selected radio configurations given in Table 8-2 are listed in below Table 8-4.  $P_{max}$  was also measured for radio configurations selected for testing time-varying Tx power transmission scenarios in order to generate test sequences following the test procedures in Section 4.1.

Table 8-3 Measured  $P_{limit}$  and  $P_{max}$  of selected radio configurations

# CONDUCTED TX CASES (FREQ < 6 GHZ)

#### 9.1 **Time-varying Tx Power Case**

thereof, please contact INFO@PCTEST.COM.

The measurement setup is shown in Figure 6-1. The purpose of the time-varying Tx power measurement is to demonstrate the effectiveness of power limiting enforcement and that the time-averaged Tx power when represented in time-averaged 1gSAR or 10gSAR values does not exceed FCC limit as shown in Eq. (1a) and (1b), rewritten below:

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
 (1a)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g_{\_or} 10gSAR(t)dt}{FCC\ SAR\ limit} \le 1$$
 (1b)

where, conducted\_Tx\_power(t), conducted\_Tx\_power\_P\_limit, and 1g\_or\_10gSAR\_P\_limit correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at Plimit, and measured 1qSAR and 10qSAR values at  $P_{limit}$  reported in Part 1 test (listed in Table 8-2 of this report as well).

Following the test procedure in Section 4.3, the conducted Tx power measurement for all selected configurations are reported in this section. In all the conducted Tx power plots, the dotted line represents the requested power by callbox (test sequence 1 or test sequence 2), the blue curve represents the instantaneous conducted Tx power measured using power meter, the green curve represents timeaveraged power and red line represents the conducted power limit that corresponds to FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

Similarly, in all the 1g or 10gSAR plots (when converted using Eq. (1a)), the green curve represents the 100s/60s-time averaged 1gSAR or 10gSAR value calculated based on instantaneous 1gSAR or 10gSAR; and the red line limit represents the FCC limit of 1.6 W/kg for 1gSAR or 4.0 W/kg for 10gSAR.

Time-varying Tx power measurements were conducted on test cases #1 ~ #5 in Table 8-2, by generating test sequence 1 and test sequence 2 given in APPENDIX E: using measured  $P_{limit}$  and measured  $P_{max}$ (last two columns of Table 8-4) for each of these test cases. Measurement results for test cases #1 ~ #5 are given in Sections 9.1.1-9.1.5.

### 9.2 **Call Drop Test Case**

This test was measured LTE Band 48, Antenna 2, DSI=6, and with callbox requesting maximum power. The call drop was manually performed when the DUT is transmitting at Preserve level as shown in the plot below (dotted black region). The measurement setup is shown in Figure 6-1. The detailed test procedure is described in Section 4.3.2.

## Call drop test result:

Plot 1: Measured Tx power (dBm) versus time shows that the transmitting power kept the same  $P_{reserve}$ level of LTE Band 48 after the call was re-established:

Plot Notes: The power level after the change in call kept the same Preserve level of LTE Band 48. The conducted power plot shows expected Tx transition.

## 9.3 Change in Technology/Band Test Case

This test was conducted with callbox requesting maximum power, and with a technology switch from LTE 48, Antenna 2, DSI = 6 to UMTS B2, Antenna 1, DSI = 6. Following procedure detailed in Section 4.3.3, and using the measurement setup shown in Figure 6-1, the technology/band switch was performed when the DUT is transmitting at *Preserve* level as shown in the plot below (dotted black region).

## Test result for change in technology/band:

Plot 1: Measured Tx power (dBm) versus time shows that the transmitting power changed from LTE 48, Antenna 2, DSI = 6 Preserve level to UMTS B2, Antenna 1, DSI = 6 Preserve level (within 1 dB device uncertainty):

Note: As per the manufacturer, Reserve power margin = 3 dB. Based on Table 8-4, EFS Plimit = 12.0dBm for LTE B48 (DSI=6), and EFS Plimit = 16dBm for UMTS B2 (DSI=6), it can be seen from above plot that the difference in Preserve (= Plimit - 3dB Reserve power margin) power level corresponds to the expected difference in *Plimit* levels of 4.0dB (within 1dB of sub6 radio design related uncertainty). Therefore, the conducted power plot shows expected transition in Tx power.

© 2020 PCTEST				REV 1.0

Plot 2: All the time-averaged conducted Tx power measurement results were converted into timeaveraged normalized SAR values using Equation (6a), (6b) and (6c), and plotted below to demonstrate that the time-averaged normalized SAR versus time does not exceed the normalized FCC limit of 1.0:

	(W/kg)
FCC normalized SAR limit	1.0
Max 100s-time averaged normalized SAR (green curve)	0.072
Validated	

The test result validated the continuity of power limiting in technology/band switch scenario.

#### 9.4 **DSI Switch Test Case**

This test was conducted with callbox requesting maximum power, and with DSI switch from LTE 25 DSI = 5 (body-worn) to DSI = 6 (hotspot). Following procedure detailed in Section 4.3.5 using the measurement setup shown in Figure 6-1, the DSI switch was performed when the DUT is transmitting at  $P_{reserve}$  level as shown in the plot below (dotted black circle).

# Test result for change in DSI:

Plot 1: Measured Tx power (dBm) versus time shows that the transmitting power changed when DSI = 5 switches to DSI = 6:

Note: As per the manufacturer, Reserve\_power\_margin = 3dB. Based on Table 8-1, EFS Plimit = 16dBm for LTE B25 body-worn DSI = 5, and EFS Plimit = 16.0 dBm for hotspot DSI = 6.The difference in Preserve (= Plimit - 3dB Reserve\_power\_margin) level corresponds to the expected different in *Plimit* levels of 0 dB (within 1dB of sub6 radio design related uncertainty). Therefore. the conducted power plot shows expected transition in Tx power.

## 9.5 Change in Time window / antenna switch test results

This test was conducted with callbox requesting maximum power, and with time-window/antenna switch between LTE B25, Antenna 1, DSI = 6 (100s window) and LTE B48, Antenna 2, DSI = 6 (60s window). Following procedure detailed in Section 4.3.6, and using the measurement setup shown in Figure 6-1(b), the time-window switch via tech/band/antenna switch was performed when the EUT is transmitting at Preserve level.

## 9.5.1 Test case 1: transition from LTE B25 to LTE B48 (i.e., 100s to 60s), then back to LTE B25

Test result for change in time-window (from 100s to 60s to 100s):

Plot 1: Measured Tx power (dBm) versus time shows that the transmitting power changed when LTE B25 switches to LTE B48 (~240 seconds timestamp) and switches back to LTE B25 (~300s seconds timestamp):

Plot Notes: As per the manufacturer, Reserve power margin = 3dB. Based on Table 8-1, EFS Plimit = 16.0dBm (Pmax = 24.0dBm) for LTE B25 DSI = 6 (100s window), and EFS Plimit = 12 dBm (Pmax = 22.0dBm) for LTE B48 DSI = 6 (60s window). The conducted power plot shows expected transitions in Tx power at ~240 seconds (100s-to-60s transition) and at ~300 seconds (60s-to-100s transition) in order to maintain total time-averaged RF exposure compliance across time windows, as show in next plot.

FCC ID: PY7-57441Y	Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by:  Quality Manager
Document S/N:	Test Dates:	DUT Type:		D 50 -4 04
1M2007070106-02.PY7	09/01/2020 - 10/15/2020	Portable Handset		Page 53 of 91
© 2020 PCTEST				REV 1.

Plot 2: All the conducted Tx power measurement results were converted into time-averaged normalized SAR values using Equation (7a), (7b) and (7c), and plotted below to demonstrate that the time-averaged normalized SAR versus time does not exceed the FCC limit of 1 unit. Equation (7a) is used to convert the Tx power of device to obtain 100s-averaged normalized SAR in LTE B25 as shown in black curve. Similarly, equation (7b) is used to obtain 60s-averaged normalized SAR in LTE B48 as shown in orange curve. Equation (7c) is used to obtain total time-averaged normalized SAR as shown in green curve (i.e., sum of black and orange curves).

	(W/kg)
FCC normalized total exposure limit	1.0
Max time averaged normalized SAR (green curve)	0.097
Validated	

Plot Notes: Maximum power is requested by callbox for the entire duration of the test, with tech/band switches from 100s-to-60s window at ~240s time stamp, and from 60s-to-100s window at ~300s time stamp. Smart Transmit controls the Tx power during these time-window switches to ensure total time-averaged RF exposure, i.e., sum of black and orange curves given by equation (7c), is always compliant. In time-window switch test, at all times the total time-averaged normalized RF exposure (green curve) should not exceed normalized  $SAR\_design\_target + 1dB$  device uncertainty. In this test, with a maximum normalized SAR of 0.097 being  $\leq 0.79$  (= 1.0/1.6 + 1dB device uncertainty), the above test result validated the continuity of power limiting in time-window switch scenario.

FCC ID: PY7-57441Y	Proud to be part of @ element	PART 2 RF EXPOSURE EVALUATION REPORT	SONY	Approved by:  Quality Manager

## 9.5.2 Test case 2: transition from LTE B48 to LTE B25 (i.e., 60s to 100s), then back to LTE 48

Test result for change in time-window (from 60s to 100s to 60s):

Plot 1: Measured Tx power (dBm) versus time shows that the transmitting power changed when LTE B48 switches to LTE B25 (~185 seconds timestamp) and switches back to LTE B48 (~285 seconds timestamp):

Note: As per the manufacturer, Reserve\_power\_margin = 3dB. Based on Table 8-1, EFS Plimit = 12.0dBm (*Pmax* = 22.0dBm) for LTE B48 DSI = 6 (60s window), and EFS *Plimit* = 16.0dBm for LTE B25 DSI = 6 (100s window). The conducted power plot shows expected transitions in Tx power at ~185s (60sto-100s transition) and at ~285s (100s-to-60s transition) in order to maintain total time-averaged RF exposure compliance across time windows, as show in next plot.

### 9.6 Switch in SAR exposure test results

This test was conducted with callbox requesting maximum power, and with the EUT in LTE B5 + Sub6 NR Band n66 call. Following procedure detailed in Section 4.3.7 and Appendix F.2, and using the measurement setup shown in Figure 6-1(c) since LTE and Sub6 NR are sharing the same antenna port, the SAR exposure switch measurement is performed with the EUT in various SAR exposure scenarios, i.e., in SAR<sub>sub6NR</sub> only scenario (t =0s ~120s), SAR<sub>su6NR</sub> + SAR<sub>LTE</sub> scenario (t =120s ~ 240s) and SAR<sub>LTE</sub> only scenario (t > 240s).

Plot 2: All the conducted Tx power measurement results were converted into time-averaged normalized SAR values using Equation (7a), (7b) and (7c), and plotted below to demonstrate that the time-averaged normalized SAR versus time does not exceed the FCC limit of 1 unit. Equation (7a) is used to convert the LTE Tx power of device to obtain 100s-averaged normalized SAR in LTE B5 as shown in black curve. Similarly, equation (7b) is used to obtain 100s-averaged normalized SAR in Sub6 NR n66 as shown in orange curve. Equation (7c) is used to obtain total time-averaged normalized SAR as shown in green curve (i.e., sum of black and orange curves).

	(W/kg)
FCC normalized total exposure limit	1.0
Max time averaged normalized SAR (green curve)	0.098
Validated	

Plot Notes: Device starts predominantly in Sub6 NR SAR exposure scenario between 0s and 120s, and in LTE SAR + Sub6 NR SAR exposure scenario between 120s and 240s, and in predominantly in LTE SAR exposure scenario after t=240s. Here, Smart Transmit allocates a maximum of 75% of exposure margin (based on 3dB reserve margin setting) for Sub6 NR. This corresponds to a normalized 1gSAR exposure value = 75% \* 0.029 W/kg measured SAR at Sub6 NR Plimit / 1.6W/kg limit = 0.014 ± 1dB device related uncertainty (see orange curve between 0s~120s). For predominantly LTE SAR exposure scenario, maximum normalized 1gSAR exposure should correspond to 100% exposure margin = 0.226 W/kg measured SAR at LTE Plimit / 1.6W/kg limit = 0.141 ± 1dB device related uncertainty (see black curve after t = 240s). Additionally, in SAR exposure switch test, at all times the total time-averaged normalized RF exposure (green curve) should not exceed normalized SAR\_design\_target + 1dB device uncertainty. In this test, with a maximum normalized SAR of 0.098 being ≤ 0.79 (= 1.0/1.6 + 1dB device uncertainty), the above test result validated the continuity of power limiting in SAR exposure switch scenario.

			3700	3.383	49.017	3.548	51.050	-4.65%	-3.98%

The above measured tissue parameters were used in the DASY software. The DASY software was used to perform interpolation to determine the dielectric parameters at the SAR test device frequencies (per KDB Publication 865664 D01v01r04 and IEEE 1528-2013 6.6.1.2). The tissue parameters listed in the SAR test plots may slightly differ from the table above due to significant digit rounding in the software.

# 11 SAR TEST RESULTS (FREQ < 6 GHZ)

# 11.1 Time-varying Tx Power Case

Following Section 4.4 procedure, time-averaged SAR measurements are conducted using a SAR probe at peak location of area scan over 500 seconds. cDASY6 system verification for SAR measurement is provided in Section 10, and the associated SPEAG certificates are attached in Appendix G.

SAR probe integration times depend on the communication signal being tested as defined in the probe calibration parameters.

Since the sampling rate used by cDASY6 for pointSAR measurements is not in user control, the number of points in 100s interval is determined from the scan duration setting in cDASY6 time-average pointSAR measurement by (100s cDASY6\_scan\_duration \* total number of pointSAR values recorded). Running average is performed over these number of points in excel spreadsheet to obtain 100s averaged point SAR.

Following Section 4.4, for each of selected technology/band (listed in Table 8-2):

- 7. With Reserve\_power\_margin set to 0 dB, area scan is performed at  $P_{limit}$ , and time-averaged pointSAR measurements are conducted to determine the pointSAR at  $P_{limit}$  at peak location, denoted as  $pointSAR_{Plimit}$ .
- 8. With Reserve\_power\_margin set to actual (intended) value, two more time-averaged pointSAR measurements are performed at the same peak location for test sequences 1 and 2.

To demonstrate compliance, all the pointSAR measurement results were converted into 1gSAR or 10gSAR values by using Equation (3a), rewritten below:

$$1g\_or\_10gSAR(t) = \frac{pointSAR(t)}{pointSAR\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
 (3a)

where, pointSAR(t),  $pointSAR\_P_{limit}$ , and  $1g\_or\_10gSAR\_P_{limit}$  correspond to the measured instantaneous point SAR, measured point SAR at  $P_{limit}$  from above step 1 and 2, and measured 1gSAR or 10gSAR values at  $P_{limit}$  obtained from Part 1 report and listed in Table 8-2 of this report.

# 12.2 mmW NR radiated power test results

To demonstrate the compliance, the conducted Tx power of LTE 2 in DSI = 6 is converted to 1gSAR exposure by applying the corresponding worst-case 1g SAR value at  $P_{limit}$  as reported in Part 1 report and listed in Table 8-2 of this report.

Similarly, following Step 4 in Section 5.3.1, radiated Tx power of mmW Band n261 and n260 for the beams tested is converted by applying the corresponding measured worst-case 4cm²PD values, and listed in below Table 12-3. Qualcomm Smart Transmit feature operates based on time-averaged Tx power reported on a per symbol basis, which is independent of modulation, channel and bandwidth (RBs), therefore the worst-case 4cm²PD was conducted with the EUT in FTM mode, with CW modulation and 100% duty cycle. cDASY6 system verification for power density measurement is provided in Section 14, and the associated SPEAG certificates are attached in Appendix G.

Both the worst-case 1gSAR and 4cm<sup>2</sup>PD values used in this section are listed in Table 12-3. The measured EIRP at *input.power.limit* for the beams tested in this section are also listed in Table 12-3.

## Total Normalized Time-averaged RF Exposure Tech: LTE, Band 2 / Tech: NR5G MMW, Band n261

FCC requirement for total RF exposure (normalized)		
Max total normalized time-averaged RF exposure (green curve)		
Validated		

Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on the 3dB reserve setting in Part 1 report). From Table 12-3, this corresponds to a normalized 4cm<sup>2</sup>PD exposure value for Beam ID 40 of (75% \* 4.01 W/m<sup>2</sup>)/(10 W/m<sup>2</sup>) = 30.1% ± 2.1dB device related uncertainty (see green/orange curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually. Towards the end of test, LTE is the dominant contributor towards RF exposure, i.e., corresponding normalized 1g SAR exposure value of (100% \* 0.142 W/kg)/(1.6 W/kg) = 8.9% ± 1dB design related uncertainty (see black curve approaching this level towards end of the test).

As can be seen, the power limiting enforcement is effective and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

#### Total Normalized Time-averaged RF Exposure Tech: LTE, Band 2 / Tech: NR5G MMW, Band n260

FCC requirement for total RF exposure (normalized)			
Max total normalized time-averaged RF exposure (green curve)			
Validated			

Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on the 3dB reserve setting in Part 1 report). From Table 12-3, this corresponds to a normalized 4cm<sup>2</sup>PD exposure value for Beam ID 40 of (75% \* 4.50 W/m<sup>2</sup>)/(10 W/m<sup>2</sup>) = 33.8% ± 2.1dB device related uncertainty (see green/orange curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually. Towards the end of test, LTE is the dominant contributor towards RF exposure, i.e., corresponding normalized 1gSAR exposure value of (100% \* 0.142 W/kg)/(1.6 W/kg) = 8.9% ± 1dB design related uncertainty (see black curve approaching this level towards end of the test).

As can be seen, the power limiting enforcement is effective and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

### 13.3 Switch in SAR vs. PD exposure test results for n261

This test was measured with LTE Band 2 (DSI = 6) and mmW Band n261 Beam ID 40, by following the detailed test procedure is described in Section 5.3.2.

Instantaneous and 100s-averaged conducted LTE Tx power versus time, instantaneous and 4s-averaged radiated mmW Tx power versus time, time-averaged conducted LTE Tx power limit and time-averaged radiated mmW Tx power limit:

LTE and mmW Instantaneous and Time-averaged TX Power Tech: LTE, Band 2 / Tech: NR5G MMW, Band n261

From the above plot, it is predominantly instantaneous PD exposure between 0s ~ 120s, it is instantaneous SAR+PD exposure between 120s ~ 130s, it is predominantly instantaneous SAR exposure between 130s ~ 240s, and above 240s, it is predominantly instantaneous PD exposure.

Normalized time-averaged exposures for LTE (1gSAR) and mmW (4cm<sup>2</sup>PD), as well as total normalized time-averaged exposure versus time:

#### Total Normalized Time-averaged RF Exposure Tech: LTE, Band 2 / Tech: NR5G MMW, Band n261

FCC requirement for total RF exposure (normalized)			
Max total normalized time-averaged RF exposure (green curve)			
Validated			

Plot notes: As soon as 5G mmW NR call was established, LTE was placed in all-down bits immediately. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on 3dB reserve setting in Part 1 report). From Table 12-3, this corresponds to a normalized 4cm<sup>2</sup>PD exposure value for Beam ID 40 of (75% \* 4.01 W/m<sup>2</sup>)/(10 W/m<sup>2</sup>) = 30.1% ± 2.1dB device related uncertainty (see orange/green curve between 0s~120s). At ~120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually (orange curve for mmW exposure goes down while black curve for LTE exposure goes up). At ~240s time mark, LTE is set to alldown bits, which results in mmW getting back RF margin slowly as seen by gradual increase in mmW exposure (orange curve for mmW exposure goes up while black curve for LTE exposure goes down). The calculated maximum RF exposure from LTE corresponds to normalized 1qSAR exposure value of (100% \* 0.142 W/kg)/(1.6 W/kg) = 8.9% ± 1dB design related uncertainty (note that this level will be achieved by green and black curves if LTE remains in all-up bits for longer time duration which was already demonstrated in maximum Tx power test in Section 13.1). Total normalized time-averaged exposure (green curve) for this test should be within the calculated range between 30.1% ± 2.1dB device related uncertainty (only PD exposure) and 8.9% ± 1dB design related uncertainty (only SAR exposure).

As can be seen, the power limiting enforcement is effective during transmission when SAR and PD exposures are switched, and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm<sup>®</sup> Smart Transmit time averaging feature is validated.

#### 14 SYSTEM VERIFICATION (FREQ > 6 GHZ)

The system was verified to be within ±0.66 dB of the power density targets on the calibration certificate according to the test system specification in the user's manual and calibration facility recommendation. The 0.66 dB deviation threshold represents the expanded uncertainty for system performance checks using SPEAG's mmWave verification sources. The same spatial resolution and measurement region used in the source calibration was applied during the system check.

The measured power density distribution of verification source was also confirmed through visual inspection to have no noticeable differences, both spatially (shape) and numerically (level) from the distribution provided by the manufacturer, per November 2017 TCBC Workshop Notes.

**Table 14-1 System Verification Results** 

	System Verification									
Syst.	Freq.	Date	Source	Probe	Normal psPD (W/m² over 4 cm²)		Deviation (dB)	Total psPD (W/	Deviation (dB)	
	(GHz)		SN	SN	measured	target		measured	target	
Q	30.00	10/14/2020	1035	9415	27.70	32.10	-0.64	28.20	32.50	-0.62
N	30.00	10/14/2020	1043	9364	24.60	26.40	-0.31	24.90	26.70	-0.30

Note: A 10 mm distance spacing was used from the reference horn antenna aperture to the probe element. This includes 4.45 mm from the reference antenna horn aperture to the surface of the verification source plus 5.55 mm from the surface to the probe. The SPEAG software requires a setting of "5.55 mm" for the correct set up.

## 15 POWER DENSITY TEST RESULTS (FREQ > 6 GHZ)

#### 15.1 PD measurement results for maximum power transmission scenario

The following configurations were measured by following the detailed test procedure is described in Section 5.4:

- 1. LTE Band 2 (DSI = 6) and mmW Band n261 Beam ID 40
- 2. LTE Band 2 (DSI = 6) and mmW Band n260 Beam ID 40

The measured conducted Tx power of LTE and ratio of  $\frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2}$  of mmW is converted into 1gSAR and 4cm<sup>2</sup>PD value, respectively, using Eq. (4a) and (4b), rewritten below:

$$1g\_or\_10gSAR(t) = \frac{conducted\_Tx\_power(t)}{conducted\_Tx\_power\_P_{limit}} * 1g\_or\_10gSAR\_P_{limit}$$
 (4a)

$$4cm^2PD(t) = \frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2} * 4cm^2PD\_input.power.limit$$
 (4b)

$$\frac{\frac{1}{T_{SAR}} \int_{t-T_{SAR}}^{t} 1g\_or\_10gSAR(t)dt}{FCC\ SAR\ limit} + \frac{\frac{1}{T_{PD}} \int_{t-T_{PD}}^{t} 4cm^2PD(t)dt}{FCC\ 4cm^2PD\ limit} \le 1 \tag{4c}$$

where,  $conducted\_Tx\_power(t)$ ,  $conducted\_Tx\_power\_P_{limit}$ , and  $1g\_or\_10gSAR\_P_{limit}$  correspond to the measured instantaneous conducted Tx power, measured conducted Tx power at  $P_{limit}$ , and measured 1gSAR or 10gSAR values at  $P_{limit}$  corresponding to LTE transmission. Similarly, pointE(t),  $pointE\_input.power.limit$ , and  $4cm^2PD@input.power.limit$  correspond to the measured instantaneous E-field, E-field at input.power.limit, and  $4cm^2PD$  value at input.power.limit. corresponding to mmW transmission.

NOTE: cDASY6 system measures relative E-field, and provides ratio of  $\frac{[pointE(t)]^2}{[pointE\_input.power.limit]^2}$  versus time.

The radio configurations tested are described in Table 12-1 and Table 12-2. The 1gSAR at  $P_{limit}$  for LTE 2 DSI = 6, the measured 4cm<sup>2</sup>PD at *input.power.limit* of mmW n261 beam 40 and n260 beam 40, are all listed in Table 12-3.

#### 15.1.1 PD test results for n261

Step 2.e plot (in Section 5.4) for normalized instantaneous and time-averaged exposures for LTE and mmW n261 beam 40:

FCC limit for total RF exposure (normalized)		
Max total normalized time-averaged RF exposure (green curve)		
Validated		

Time (s)

Plot notes: LTE was placed in all-down bits immediately after 5G mmW NR call was established. Between 0s~120s, mmW exposure is the dominant contributor. Here, Smart Transmit feature allocates a maximum of 75% for mmW (based on the 3dB reserve setting in Part 1 report). From Table 12-3, this corresponds to a normalized 4cm<sup>2</sup>PD exposure value for Beam ID 40 of (75% \* 4.01 W/m<sup>2</sup>)/(10 W/m<sup>2</sup>) = 30.1% ± 2.1dB device related uncertainty (see orange/green curve between 0s~120s). Around 120s time mark, LTE is set to all-up bits, taking away margin from mmW exposure gradually. Towards the end of the test, LTE is the dominant contributor towards RF exposure, i.e., corresponding normalized 1gSAR exposure value of (100% \* 0.142 W/kg)/(1.6 W/kg) = 8.9% ± 1dB design related uncertainty (see black curves approaching this level towards end of the test).

As can be seen, the power limiting enforcement is effective and the total normalized time-averaged RF exposure does not exceed 1.0. Therefore, Qualcomm® Smart Transmit time averaging feature is validated.

#### Notes:

- 1. CBT (Calibrated Before Testing). Prior to testing, the measurement paths containing a cable, amplifier, attenuator, coupler or filter were connected to a calibrated source (i.e. a signal generator) to determine the losses of the measurement path. The power meter offset was then adjusted to compensate for the measurement system losses. This level offset is stored within the power meter before measurements are made. This calibration verification procedure applies to the system verification and output power measurements. The calibrated reading is then taken directly from the power meter after compensation of the losses for all final power measurements.
- Each equipment item is used solely within its respective calibration period.
- Due to the worldwide pandemic caused by the novel SAR-CoV-2 virus (COVID-19), special calibration extensions have been permitted by A2LA. Some equipment had its calibration period extended accordingly and will be calibrated when possible.

### 18 CONCLUSION

#### 18.1 Measurement Conclusion

The SAR evaluation indicates that the DUT complies with the RF radiation exposure limits of the FCC and Innovation, Science, and Economic Development Canada, with respect to all parameters subject to this test. These measurements were taken to simulate the RF effects of RF exposure under worst-case conditions. Precise laboratory measures were taken to assure repeatability of the tests. The results and statements relate only to the item(s) tested.

Please note that the absorption and distribution of electromagnetic energy in the body are very complex phenomena that depend on the mass, shape, and size of the body, the orientation of the body with respect to the field vectors, and the electrical properties of both the body and the environment. Other variables that may play a substantial role in possible biological effects are those that characterize the environment (e.g. ambient temperature, air velocity, relative humidity, and body insulation) and those that characterize the individual (e.g. age, gender, activity level, debilitation, or disease). Because various factors may interact with one another to vary the specific biological outcome of an exposure to electromagnetic fields, any protection guide should consider maximal amplification of biological effects as a result of field-body interactions, environmental conditions, and physiological variables. [3]

### APPENDIX B: SAR TISSUE SPECIFICATIONS

#### **Measurement Procedure for Tissue verification:**

- 1) The network analyzer and probe system was configured and calibrated.
- 2) The probe was immersed in the tissue. The tissue was placed in a nonmetallic container. Trapped air bubbles beneath the flange were minimized by placing the probe at a slight angle.
- 3) The complex admittance with respect to the probe aperture was measured
- 4) The complex relative permittivity  $\epsilon$  can be calculated from the below equation (Pournaropoulos and Misra):

$$Y = \frac{j2\omega\varepsilon_{r}\varepsilon_{0}}{\left[\ln(b/a)\right]^{2}} \int_{a}^{b} \int_{a}^{b} \int_{0}^{\pi} \cos\phi' \frac{\exp\left[-j\omega r(\mu_{0}\varepsilon_{r}'\varepsilon_{0})^{1/2}\right]}{r} d\phi' d\rho' d\rho$$

where Y is the admittance of the probe in contact with the sample, the primed and unprimed coordinates refer to source and observation points, respectively,  $r^2 = \rho^2 + \rho'^2 - 2\rho\rho'\cos\phi'$ ,  $\omega$  is the angular frequency, and  $\dot{J} = \sqrt{-1}$ .

#### APPENDIX C: SAR SYSTEM VALIDATION

Per FCC KDB Publication 865664 D02v01r02, SAR system validation status should be documented to confirm measurement accuracy. The SAR systems (including SAR probes, system components and software versions) used for this device were validated against its performance specifications prior to the SAR measurements. Reference dipoles were used with the required tissue- equivalent media for system validation, according to the procedures outlined in FCC KDB Publication 865664 D01v01r04 and IEEE 1528-2013. Since SAR probe calibrations are frequency dependent, each probe calibration point was validated at a frequency within the valid frequency range of the probe calibration point, using the system that normally operates with the probe for routine SAR measurements and according to the required tissue-equivalent media.

A tabulated summary of the system validation status including the validation date(s), measurement frequencies, SAR probes and tissue dielectric parameters has been included.

Table C-1
SAR System Validation Summary – 1g

SAR	Freq.		Brobo			Probe		Cond.	Perm.	CM	/ VALIDAT	ION	MOI	D. VALIDAT	TON
System	(MHz)	Date	SN	Probe C	al Point	(σ)	(Er)	SENSITIVITY	PROBE LINEARITY	PROBE ISOTROPY	MOD. TYPE	DUTY FACTOR	PAR		
N	1750	9/8/2020	3914	1750	Body	1.476	53.334	PASS	PASS	PASS	N/A	N/A	N/A		
М	1900	5/19/2020	7526	1900	Body	1.585	53.549	PASS	PASS	PASS	GMSK	PASS	N/A		
M	3700	7/16/2020	7526	3700	Body	3.394	51.953	PASS	PASS	PASS	TDD	PASS	N/A		

NOTE: While the probes have been calibrated for both CW and modulated signals, all measurements were performed using communication systems calibrated for CW signals only. Modulations in the table above represent test configurations for which the measurement system has been validated per FCC KDB Publication 865664 D01v01r04 for scenarios when CW probe calibrations are used with other signal types. SAR systems were validated for modulated signals with a periodic duty cycle, such as GMSK, or with a high peak to average ratio (>5 dB), such as OFDM according to FCC KDB Publication 865664 D01v01r04.

2020 PCTEST

## **APPENDIX E: TEST SEQUENCES**

- 1. Test sequence is generated based on below parameters of the DUT:
  - a. Measured maximum power ( $P_{max}$ )
  - b. Measured Tx\_power\_at\_SAR\_design\_target (Plimit)
  - c. Reserve\_power\_margin (dB)
    - Preserve (dBm) = measured P<sub>limit</sub> (dBm) Reserve\_power\_margin (dB)
  - d. SAR\_time\_window (100s for FCC)
- 2. Test Sequence 1 Waveform:

Based on the parameters above, the Test Sequence 1 is generated with one transition between high and low Tx powers. Here, high power =  $P_{max}$ ; low power =  $P_{max}$ /2, and the transition occurs after 80 seconds at high power  $P_{max}$ . As long as the power enforcement is taking into effective during one 100s/60s time window, the validation test with this defined test sequence 1 is valid, otherwise, select other radio configuration (band/DSI within the same technology group) having lower  $P_{limit}$  for this test. The Test sequence 1 waveform is shown below:

Figure E-1

## 3. Test Sequence 2 Waveform:

Based on the parameters described above, the Test Sequence 2 is generated as described in Table 10-1, which contains two 170 second-long sequences (yellow and green highlighted rows) that are mirrored around the center row of 20s, resulting in a total duration of 360 seconds:

### APPENDIX F: TEST PROCEDURES FOR SUB6 NR + NR RADIO

Appendix F provides the test procedures for validating Qualcomm Smart Transmit feature for LTE + Sub6 NR non-standalone (NSA) mode transmission scenario, where sub-6GHz LTE link acts as an anchor.

#### F.1 Time-varying Tx power test for sub6 NR in NSA mode

Follows Section 4.2.1 to select test configurations for time-varying test. This test is performed with two pre-defined test sequences (described in Section 4.1) applied to Sub6 NR (with LTE on all-down bits or low power for the entire test after establishing the LTE+Sub6 NR call with the callbox). Follow the test procedures described in Section 4.3.1 to demonstrate the effectiveness of power limiting enforcement and that the time averaged Tx power of Sub6 NR when converted into 1gSAR values does not exceed the regulatory limit at all times (see Eq. (1a) and (1b)). Sub6 NR response to test sequence1 and test sequence2 will be similar to other technologies (say, LTE), and are shown in Sections 9.1.6 and 9.1.7.

### F.2 Switch in SAR exposure between LTE vs. Sub6 NR during transmission

This test is to demonstrate that Smart Transmit feature accurately accounts for switching in exposures among SAR for LTE radio only, SAR from both LTE radio and sub6 NR, and SAR from sub6 NR only scenarios, and ensures total time-averaged RF exposure compliance with FCC limit.

#### Test procedure:

- 1. Measure conducted Tx power corresponding to  $P_{limit}$  for LTE and sub6 NR in selected band. Test condition to measure conducted  $P_{limit}$  is:
  - Establish device in call with the callbox for LTE in desired band. Measure conducted Tx power corresponding to LTE P<sub>limit</sub> with Smart Transmit <u>enabled</u> and Reserve power margin set to 0 dB, callbox set to request maximum power.
  - □ Repeat above step to measure conducted Tx power corresponding to Sub6 NR <u>Plimit</u>. If testing LTE+Sub6 NR in non-standalone mode, then establish LTE+Sub6 NR call with callbox and request all down bits for radio1 LTE. In this scenario, with callbox requesting maximum power from Sub6 NR, measured conducted Tx power corresponds to radio2 <u>Plimit</u> (as radio1 LTE is at all-down bits)
- 2. Set Reserve\_power\_margin to actual (intended) value with EUT setup for LTE + Sub6 NR call. First, establish LTE connection in all-up bits with the callbox, and then Sub6 NR connection is added with callbox requesting UE to transmit at maximum power in Sub6 NR. As soon as the Sub6 NR connection is established, request all-down bits on LTE link (otherwise, Sub6 NR will not have sufficient RF exposure margin to sustain the call with LTE in all-up bits). Continue LTE (all-down bits)+Sub6 NR transmission for more than one time-window duration to test predominantly Sub6 NR SAR exposure scenario (as SAR exposure is negligible from all-down bits in LTE). After at least one time-window, request LTE to go all-up bits to test LTE SAR and Sub6 NR SAR exposure scenario. After at least one more time-window, drop (or request all-down bits) Sub6 NR transmission to test predominantly LTE SAR exposure scenario. Continue the test for at least one more time-window. Record the conducted Tx powers for both LTE and Sub6 NR for the entire duration of this test.

FCC ID: PY7-57441Y	POTEST PART 2 RF EXPOSURE EVALUATION REPORT SONY	Approved by:  Quality Manager
Test Dates:	DUT Type:	APPENDIX F
09/01/2020 - 10/15/2020	Portable Handset	Page 1 of 2

- 3. Once the measurement is done, extract instantaneous Tx power versus time for both LTE and Sub6 NR links. Similar to technology/band switch test in Section 4.3.3, convert the conducted Tx power for both these radios into 1gSAR value (see Eq. (6a) and (6b)) using corresponding technology/band  $P_{limit}$  measured in Step 1, and then perform 100s running average to determine time-averaged 1gSAR versus time as illustrated in Figure 4-1. Note that here it is assumed both radios have Tx frequencies < 3GHz, otherwise, 60s running average should be performed for radios having Tx frequency between 3GHz and 6GHz.
- 4. Make one plot containing: (a) instantaneous Tx power versus time measured in Step 2.
- 5. Make another plot containing: (a) instantaneous 1gSAR versus time determined in Step 3, (b) computed time-averaged 1gSAR versus time determined in Step 3, and (c) corresponding regulatory 1gSAR<sub>limit</sub> of 1.6W/kg.

The validation criteria is, at all times, the time-averaged 1gSAR versus time shall not exceed the regulatory 1gSAR<sub>limit</sub> of 1.6W/kg.

### Glossary:

TSL

tissue simulating liquid

ConvF N/A

sensitivity in TSL / NORM x,y,z

not applicable or not measured

### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Additional Documentation:

e) DASY4/5 System Handbook

#### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point.
   No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

## **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

DASY Version	DASY5	V52.10.4
Extrapolation	Advanced Extrapolation	
Phantom	Modular Flat Phantom	
Distance Dipole Center - TSL	10 mm	with Spacer
Zoom Scan Resolution	dx, dy, dz = 5 mm	**************************************
Frequency	1750 MHz ± 1 MHz	1,7754WW 1,7754WW

## **Head TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Head TSL parameters	22.0 °C	40.1	1.37 mho/m
Measured Head TSL parameters	(22.0 ± 0.2) °C	40.3 ± 6 %	1.35 mho/m ± 6 %
Head TSL temperature change during test	< 0.5 °C		

## SAR result with Head TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL	Condition	
SAR measured	250 mW input power	8.88 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	35.9 W/kg ± 17.0 % (k=2)

SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL	condition		
SAR measured	250 mW input power	4.69 W/kg	
SAR for nominal Head TSL parameters	normalized to 1W	18.9 W/kg ± 16.5 % (k=2)	

## **Body TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Body TSL parameters	22.0 °C	53.4	1.49 mho/m
Measured Body TSL parameters	(22.0 ± 0.2) °C	54.1 ± 6 %	1.47 mho/m ± 6 %
Body TSL temperature change during test	< 0.5 °C		

## SAR result with Body TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL	Condition	
SAR measured	250 mW input power	8.98 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	36.3 W/kg ± 17.0 % (k=2)

SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL	condition	
SAR measured	250 mW input power	4.80 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	19.3 W/kg ± 16.5 % (k=2)

## Appendix (Additional assessments outside the scope of SCS 0108)

#### Antenna Parameters with Head TSL

Impedance, transformed to feed point	49.2 Ω - 1.9 jΩ
Return Loss	- 33.6 dB

## **Antenna Parameters with Body TSL**

Impedance, transformed to feed point	45.0 Ω - 1.7 jΩ
Return Loss	- 25.2 dB

### **General Antenna Parameters and Design**

Electrical Delay (one direction)	1.222 ns

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

#### **Additional EUT Data**

Manufactured by	SPEAG

Certificate No: D1750V2-1148\_May20 Page 4 of 8

#### **DASY5 Validation Report for Head TSL**

Date: 12.05.2020

Test Laboratory: SPEAG, Zurich, Switzerland

#### DUT: Dipole 1750 MHz; Type: D1750V2; Serial: D1750V2 - SN:1148

Communication System: UID 0 - CW; Frequency: 1750 MHz

Medium parameters used: f = 1750 MHz;  $\sigma = 1.35 \text{ S/m}$ ;  $\varepsilon_r = 40.3$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

#### **DASY52** Configuration:

Probe: EX3DV4 - SN7349; ConvF(8.76, 8.76, 8.76) @ 1750 MHz; Calibrated: 31.12.2019

• Sensor-Surface: 1.4mm (Mechanical Surface Detection)

Electronics: DAE4 Sn601; Calibrated: 27.12.2019

• Phantom: Flat Phantom 5.0 (front); Type: QD 000 P50 AA; Serial: 1001

• DASY52 52.10.4(1527); SEMCAD X 14.6.14(7483)

## Dipole Calibration for Head Tissue/Pin=250 mW, d=10mm/Zoom Scan (7x7x7)/Cube 0:

Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 105.6 V/m; Power Drift = -0.03 dB

Peak SAR (extrapolated) = 16.4 W/kg

#### SAR(1 g) = 8.88 W/kg; SAR(10 g) = 4.69 W/kg

Smallest distance from peaks to all points 3 dB below = 10 mm

Ratio of SAR at M2 to SAR at M1 = 54.4%

Maximum value of SAR (measured) = 13.8 W/kg

0 dB = 13.8 W/kg = 11.40 dBW/kg

## Impedance Measurement Plot for Head TSL

## **DIPOLE CALIBRATION EXTENSION**

Per KDB 865664 D01, calibration intervals of up to three years may be considered for reference dipoles when it is demonstrated that the SAR target, impedance and return loss of a dipole have remained stable according to the following requirements:

- 1. The measured SAR does not deviate more than 10% from the target on the calibration certificate.
- 2. The return-loss does not deviate more than 20% from the previous measurement and meets the required 20dB minimum return-loss requirement.
- 3. The measurement of real or imaginary parts of impedance does not deviate more than  $5\Omega$  from the previous measurement.

The following dipole was checked to pass the above 3 requirements to have 2-year calibration period from the calibration date:

Calibration Date	Extension Date	Certificate Electrical Delay (ns)	Certificate SAR Target Head (1g) W/kg @ 20.0 dBm	Measured Head SAR (1g) W/kg @ 20.0 dBm	(0/)	Certificate SAR Target Head (10g) W/kg @ 20.0 dBm	(40-) M(4 ©	Deviation 10g (%)	Certificate Impedance Head (Ohm) Real	Measured Impedance Head (Ohm) Real	Difference (Ohm) Real	Certificate Impedance Head (Ohm) Imaginary	Measured Impedance Head (Ohm) Imaginary	Difference (Ohm) Imaginary	Certificate Return Loss Head (dB)	Measured Return Loss Head (dB)	Deviation (%)	PASS/FAIL

## **CALIBRATION CERTIFICATE**

Object

D3700V2 - SN:1067

Calibration procedure(s)

CIA CAL-22, pt

Calibration date:

January 21, 2020

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

N/A not applicable or not measured

## Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### **Additional Documentation:**

e) DASY4/5 System Handbook

#### **Methods Applied and Interpretation of Parameters:**

- Measurement Conditions: Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: D3700V2-1067\_Jan20 Page 2 of 8

#### **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

DASY Version	DASY5	V52.10.3
Extrapolation	Advanced Extrapolation	
Phantom	Modular Flat Phantom	
Distance Dipole Center - TSL	10 mm	with Spacer
Zoom Scan Resolution	dx, dy = 4  mm, dz = 1.4  mm	Graded Ratio = 1.4 (Z direction)
Frequency	3700 MHz ± 1 MHz	

## **Head TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Head TSL parameters	22.0 °C	37.7	3.12 mho/m
Measured Head TSL parameters	(22.0 ± 0.2) °C	36.8 ± 6 %	3.05 mho/m ± 6 %
Head TSL temperature change during test	< 0.5 °C		

#### SAR result with Head TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL	Condition	
SAR measured	100 mW input power	6.72 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	67.2 W/kg ± 19.9 % (k=2)

SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL	condition	
SAR measured	100 mW input power	2.44 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	24.3 W/kg ± 19.5 % (k=2)

## **Body TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Body TSL parameters	22.0 °C	51.0	3.55 mho/m
Measured Body TSL parameters	(22.0 ± 0.2) °C	49.5 ± 6 %	3.54 mho/m ± 6 %
Body TSL temperature change during test	< 0.5 °C		

## SAR result with Body TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL	Condition	
SAR measured	100 mW input power	6.56 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	65.2 W/kg ± 19.9 % (k=2)

SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL	condition	
SAR measured	100 mW input power	2.34 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	23.3 W/kg ± 19.5 % (k=2)

Certificate No: D3700V2-1067\_Jan20 Page 3 of 8

## Appendix (Additional assessments outside the scope of SCS 0108)

#### Antenna Parameters with Head TSL

Impedance, transformed to feed point	48.7 Ω - 0.4 jΩ
Return Loss	- 37.4 dB

### Antenna Parameters with Body TSL

Impedance, transformed to feed point	47.6 Ω + 1.9 jΩ
Return Loss	- 30.2 dB

#### **General Antenna Parameters and Design**

Electrical Delay (one direction)	1.141 ns

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

#### Additional EUT Data

Manufactured by	SPEAG

Certificate No: D3700V2-1067\_Jan20 Page 4 of 8

#### **DASY5 Validation Report for Head TSL**

Date: 21.01.2020

Test Laboratory: SPEAG, Zurich, Switzerland

## DUT: Dipole 3700 MHz; Type: D3700V2; Serial: D3700V2 - SN:1067

Communication System: UID 0 - CW; Frequency: 3700 MHz

Medium parameters used: f = 3700 MHz;  $\sigma = 3.05 \text{ S/m}$ ;  $\varepsilon_r = 36.8$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

#### DASY52 Configuration:

• Probe: EX3DV4 - SN3503; ConvF(7.73, 7.73, 7.73) @ 3700 MHz; Calibrated: 31.12.2019

• Sensor-Surface: 1.4mm (Mechanical Surface Detection)

• Electronics: DAE4 Sn601; Calibrated: 27.12.2019

• Phantom: Flat Phantom 5.0 (front); Type: QD 000 P50 AA; Serial: 1001

DASY52 52.10.3(1513); SEMCAD X 14.6.13(7474)

## Dipole Calibration for Head Tissue/Pin=100 mW, d=10mm/Zoom Scan, dist=1.4mm

(8x8x8)/Cube 0: Measurement grid: dx=4mm, dy=4mm, dz=1.4mm

Reference Value = 70.34 V/m; Power Drift = -0.05 dB

Peak SAR (extrapolated) = 19.4 W/kg

#### SAR(1 g) = 6.72 W/kg; SAR(10 g) = 2.44 W/kg

Smallest distance from peaks to all points 3 dB below = 8.4 mm

Ratio of SAR at M2 to SAR at M1 = 72.9%

Maximum value of SAR (measured) = 13.4 W/kg

0 dB = 13.4 W/kg = 11.27 dBW/kg

## Impedance Measurement Plot for Head TSL

#### **DASY5 Validation Report for Body TSL**

Date: 21.01.2020

Test Laboratory: SPEAG, Zurich, Switzerland

#### DUT: Dipole 3700 MHz; Type: D3700V2; Serial: D3700V2 - SN:1067

Communication System: UID 0 - CW; Frequency: 3700 MHz

Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS)

The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossary:

NORMx,y,z sensitivity in free space DCP diode compression point

CF crest factor (1/duty\_cycle) of the RF signal modulation dependent linearization parameters

Polarization  $\varphi$   $\varphi$  rotation around probe axis

Polarization 9 9 rotation around an axis that is in the plane normal to probe axis (at measurement center),

i.e., 9 = 0 is normal to probe axis

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system Sensor Angles sensor deviation from the probe axis, used to calculate the field orientation and polarization

k is the wave propagation direction

Calibration is Performed According to the Following Standards:

a) IEEE Std 1309-2005, "IEEE Standard for calibration of electromagnetic field sensors and probes, excluding antennas, from 9 kHz to 40 GHz", December 2005

## Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 9 = 0 for XY sensors and 9 = 90 for Z sensor (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). For frequencies > 6 GHz, the far field in front of waveguide horn antennas is measured for a set of frequencies in various waveguide bands up to 110 GHz.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- The frequency sensor model parameters are determined prior to calibration based on a frequency sweep (sensor model involving resistors R, R<sub>p</sub>, inductance L and capacitors C, C<sub>p</sub>).
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- Sensor Offset: The sensor offset corresponds to the mechanical from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).
- Equivalent Sensor Angle: The two probe sensors are mounted in the same plane at different angles. The angles are assessed using the information gained by determining the NORMx (no uncertainty required).
- Spherical isotropy (3D deviation from isotropy): in a locally homogeneous field realized using an open waveguide / horn setup.

## DASY - Parameters of Probe: EUmmWV3 - SN:9364

60	23.0	0.00	-0.01	± 0.98 dB
65	27.4	-0.24	-0.04	± 0.98 dB
70	23.9	0.03	0.01	± 0.98 dB
75	20.0	-0.03	-0.13	± 0.98 dB
75	14.8	-0.03	-0.02	± 0.98 dB
80	22.5	0.24	0.31	± 0.98 dB
85	22.8	0.05	0.07	± 0.98 dB
90	23,8	0.02	0.06	± 0.98 dB
92	23.9	-0.08	-0.13	± 0.98 dB
95	20.5	0.03	-0.17	± 0.98 dB
97	24.4	-0.16	-0.19	± 0.98 dB
100	22.6	0.06	-0.07	± 0.98 dB
105	22.7	-0.14	0.00	± 0.98 dB
110	19.7	0.16	0.20	± 0.98 dB

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>&</sup>lt;sup>B</sup> Numerical linearization parameter; uncertainty not required.

<sup>&</sup>lt;sup>E</sup> Uncertainty is determined using the max, deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

### CALIBRATION CERTIFICATE

Object

EUmmWV3 - SN:9415

Calibration procedure(s)

QA CAL-02.v9, QA CAL-25.v7, QA CAL-42.v2

Calibration procedure for E-field probes optimized for close near field

evaluations in air

Calibration date:

February 14, 2020

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID	Cal Date (Certificate No.)	Scheduled Calibration
Power meter NRP	SN: 104778	03-Apr-19 (No. 217-02892/02893)	Apr-20
Power sensor NRP-Z91	SN: 103244	03-Apr-19 (No. 217-02892)	Apr-20
Power sensor NRP-Z91	SN: 103245	03-Apr-19 (No. 217-02893)	Apr-20
Reference 20 dB Attenuator	SN: S5277 (20x)	04-Apr-19 (No. 217-02894)	Apr-20
Reference Probe ER3DV6	SN: 2328	05-Oct-19 (No. ER3-2328_Oct19)	Oct-20
DAE4	SN: 789	27-Dec-19 (No. DAE4-789_Dec19)	Dec-20
Secondary Standards	ID	Check Date (in house)	Scheduled Check
Power meter E4419B	SN: GB41293874	06-Apr-16 (in house check Jun-18)	In house check: Jun-20
Power sensor E4412A	SN: MY41498087	06-Apr-16 (in house check Jun-18)	In house check: Jun-20

## Calibration Laboratory of Schmid & Partner

**Engineering AG** Zeughausstrasse 43, 8004 Zurich, Switzerland

Schweizerischer Kalibrierdienst S Service suisse d'étalonnage C Servizio svizzero di taratura S Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS)

The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossarv:

NORMx,y,z sensitivity in free space DCP diode compression point

CF crest factor (1/duty\_cycle) of the RF signal A, B, C, D modulation dependent linearization parameters

Polarization o φ rotation around probe axis

Polarization § 9 rotation around an axis that is in the plane normal to probe axis (at measurement center),

i.e., 9 = 0 is normal to probe axis

information used in DASY system to align probe sensor X to the robot coordinate system Connector Angle Sensor Angles sensor deviation from the probe axis, used to calculate the field orientation and polarization

is the wave propagation direction

Calibration is Performed According to the Following Standards:

IEEE Std 1309-2005, "IEEE Standard for calibration of electromagnetic field sensors and probes, excluding antennas, from 9 kHz to 40 GHz", December 2005

#### Methods Applied and Interpretation of Parameters:

- *NORMx,y,z*: Assessed for E-field polarization  $\vartheta = 0$  for XY sensors and  $\vartheta = 90$  for Z sensor (f  $\leq 900$  MHz in TEM-cell; f > 1800 MHz: R22 waveguide). For frequencies > 6 GHz, the far field in front of waveguide horn antennas is measured for a set of frequencies in various waveguide bands up to 110 GHz.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- The frequency sensor model parameters are determined prior to calibration based on a frequency sweep (sensor model involving resistors R, R<sub>0</sub>, inductance L and capacitors C, C<sub>0</sub>).
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- Sensor Offset: The sensor offset corresponds to the mechanical from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).
- Equivalent Sensor Angle: The two probe sensors are mounted in the same plane at different angles. The angles are assessed using the information gained by determining the NORMx (no uncertainty required).
- Spherical isotropy (3D deviation from isotropy): in a locally homogeneous field realized using an open waveguide / horn setup.

75	20.0	-0.07	0.07	± 0.98 dB
75	14.8	-0.06	-0.08	± 0.98 dB
80	22.5	0.04	0.18	± 0.98 dB
85	22.8	0.01	-0.05	± 0.98 dB
90	23.8	0.03	0.06	± 0.98 dB
92	23.9	-0.09	-0.16	± 0.98 dB
95	20.5	-0.10	-0.17	± 0.98 dB
97	24.4	0.02	-0.07	± 0.98 dB
100	22.6	-0.04	-0.04	± 0.98 dB
105	22.7	-0.08	0.00	± 0.98 dB
110	19.7	0.14	0.14	± 0.98 dB

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>&</sup>lt;sup>B</sup> Numerical linearization parameter: uncertainty not required.

E Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.
