

Statement of the test house CETECOM ICT Services GmbH
Saarbrücken

to the test reports 2-2746-01-01/01 and 2-2519-A/01.

Both test reports are regarding the same product, but not the identical sample.

In the report 2519 you find the radiated power (EIRP) at page 3 with 0.389mW, in the other report also at page 3 within 0.54 mW.

This is a difference of 1.42 dB and in our opinion a normal difference in the results.

The results at page 20 in report 2519 are conducted results. At page 24 you can find the related radiated output power. (lower results => negative gain of the antenna see also page 7 of the old Report)

We have here a negative gain of the antenna. That is possible since the company uses the same antenna for GSM and Bluetooth.

So we find, that the measured radiated results are within 3 dB and correct in our opinion.

Best regards

Harro Ames
