1. ATTESTATION OF TEST RESULTS

Applicant Name:	Sony Mobile Communications Inc
Application Purpose	☒ Original Grant
DUT Description	The EUT is a GSM/WCDMA/LTE Phone + Bluetooth, DTS/UNII a/b/g/n/ac + NFC & ANT+
Test Device is	An identical Prototype
Device Category	Portable
Exposure Category	General Population/Uncontrolled Exposure
Date tested	09 June 2014
HAC Rating	M3
Applicable Standards	ANSI C63.19-2011
Test Results	Pass
UL Verification Services Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Verification Services Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties are in accordance with the above standard and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report. Note: The results documented in this report apply only to the tested sample(s), under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Verification Services Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Verification Services Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by UKAS, or any agency of any government. This report is written to support regulatory compliance of the applicable standards stated above.	
Approved & Released By:	Prepared By:

2. SUMMARY OF TEST RESULTS

Test Name	Specification Reference	Device Category	Result
Hearing Aid Compatibility - GSM 850	FCC CFR47 Part 20.19 ANSI C63.19-2011	M4	
Hearing Aid Compatibility - PCS 1900	FCC CFR47 Part 20.19 ANSI C63.19-2011	M3	
Hearing Aid Compatibility – UMTS FDD 2	FCC CFR47 Part 20.19 ANSI C63.19-2011	M4*	
Hearing Aid Compatibility – UMTS FDD 4	FCC CFR47 Part 20.19 ANSI C63.19-2011	M4*	
Hearing Aid Compatibility – UMTS FDD 5	FCC CFR47 Part 20.19 ANSI C63.19-2011	M4*	
Key to Results  = Complied  = Did not comply			

Conclusion:

Overall HAC RF Emissions Category = M3

*Categorised as M4 based on Low Power Exemption Rule in accordance with ANSI C63.19-2011

3. TEST METHODOLOGY

The tests documented in this report were performed in accordance with ANSI C63.19-2011 Methods of Measurement of Compatibility between Wireless Communications Devices and Hearing Aids, FCC KDB 285076 D01 HAC Guidance v04.

4. CALIBRATION AND UNCERTAINTY

4.1. Measuring Instrument Calibration

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

UL No.	Instrument	Manufacturer	Type No.	Serial No.	Date Last Calibrated	Cal. Interval (Months)

5. EQUIPMENT UNDER TEST (EUT)

5.1. Identification of Equipment Under Test (EUT)

Brand Name:	Sony
Serial Number:	CB5A1Z7PNS
IMEI Number:	00440245-270547-2
Hardware Version Number:	A
Software Version Number:	ATPV:1283-9868
Country of Manufacture:	China
Date of Receipt:	08 June 2014

Note(s):

1. IMEI: 00440245-270547-2 used to perform HAC RF Emissions testing only.

The EUT supports GSM 850/1900MHz bands, WCDMA FDD bands 2/4/5, LTE FDD bands 2/4/5/7/13/17 bands. It also supports Dual Transfer Mode Class 11 (DTM ~Voice +Data), GPRS service with multi-slots class 33, EGPRS service with multi-slots class 33, HSPA with HSDPA (Category 24) and HSUPA (Category 6) features are also supported. It has MP3, camera, FM radio, USB memory, GPS receiver, NFC, Mobile High-Definition Link (MHL), Bluetooth (EDR and Bluetooth 4.0), WLAN (802.11 a/b/g/n/ac) and Wi-Fi hotspot functions with 'Auto RF Power Back-Off' mode capabilities.

5.2. List of Air Interfaces/Bands & Operating Modes

Air-Interface	Bands (MHz)	Type Transport	HAC Tested	Simultaneous but not Tested ¹	Concurrent HAC Tested or not Tested	Voice over digital Transport OTT Capability	Wi-Fi Low Power	Additional GSM Power Reduction

WiFi	5500	DT	No	Yes –WCDMA	NA	Yes	No	NA
WiFi	5800	DT	No	Yes –WCDMA	NA	Yes	No	NA
BT	2400	DT	No	Yes –WCDMA	NA	NA	NA	NA
Type Transport VO = Voice only DT = Digital Transport VD = CMRS and Data transport (HAC Tested)					- At the present time the C63.19 standard does not provide simultaneous transmission test procedures. - Dual Transfer Mode (Voice + Data) concurrent mode was tested and found to give better rating than Voice only. Worst case mode is documented in this report. - Low Power Exemption for WCDMA Bands as sum of average antenna input power plus its MIF is ≤ 17 dBm (Refer Section 9) - LTE VoLTE CMRS Services were not tested for M and T rating as confirmed via an FCC KDB inquiry.			

6. SYSTEM SPECIFICATIONS

E-field measurements are performed using the DASY5 automated dosimetric assessment system. The DASY5 is made by Schmid & Partner Engineering AG (SPEAG) in Zurich, Switzerland.
The DASY5 HAC Extension consists of the following parts:

Test Arch Phantom

The specially designed Test Arch allows high precision positioning of both the device and any of the validation dipoles.

ER3DV6 Isotropic E-Field Probe	
Construction:	One dipole parallel, two dipoles normal to probe axis Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., glycoether)
Calibration:	In air from 100 MHz to 3.0 GHz (absolute accuracy $\pm 6.0\%$, $k=2$)
Frequency:	100 MHz to > 6 GHz; Linearity: ± 0.2 dB (100 MHz to 3 GHz)
Directivity:	± 0.2 dB in air (rotation around probe axis)
	± 0.4 dB in air (rotation normal to probe axis)
Dynamic Range:	2 V/m to > 1000 V/m; Linearity: ± 0.2 dB
Dimensions:	Overall length: 330 mm (Tip: 16 mm)

7. SYSTEM VALIDATION

The test setup should be validated when configured initially and hereafter at regular intervals to ensure proper function. The validation for RF setup is carried out using a dipole antenna for which field levels were computed by numeric modelling. The dipole antenna serves as a known source of electrical and magnetic output. The measured readings after validating the system are compared to the simulated values during calibration of the reference dipole

7.1. Procedure

- Average input power to dipole = 100mW (20dBm)
- Place the calibrated reference dipole antenna under the arc phantom such that the arms of the dipole are parallel to the dielectric wire.
- The probes and their cables are parallel to the coaxial feed of the dipole antenna
- The probe to dipole separation, measured from the closest surface of the dipole to centre point of probe sensor element should be 15mm

The length of the dipole is scanned with an E-probe and the maximum E-field is measured at the two ends of the dipole. The average of these two readings is compared to that in the calibration certificate.

Figure 1: Setup Diagram

7.2. System Validation Results**Date: 09/06/2014****Validation Dipole and Serial Number: CD835V3; SN1000**

Frequency (MHz)	Room Temp	Max. Measured (V/m)		Average E-field at 15mm (V/m)*	Target Value (V/m)	Deviation (%)
		High End	Low End			
835	24.0 °C	107.70	102.60	105.15	108.7	-3.27

Date: 09/06/2014**Validation Dipole and Serial Number: CD1880V3; SN1000**

Frequency (MHz)	Room Temp	Max. Measured (V/m)		Average E-field at 15mm (V/m)*	Target Value (V/m)	Deviation (%)
		High End	Low End			
1880	24.0 °C	85.55	85.06	85.31	89.30	-4.47

Note(s):

- 1) Delta (Deviation) % = 100 * (Measured value minus Target value) divided by the Target value. Deltas within $\pm 25\%$ are acceptable, of which 12% is deviation and 13% is measurement uncertainty.
- 2) The maximum E-field or were evaluated and compared to the target values provided by SPEAG in the calibration certificate of specific dipoles.
- 3) Please refer to the appendix for detailed measurement data and plots.

*Average E-field = (Max. Measured High End + Max. Measured Low End)/2

8. MODULATION INTERFERENCE FACTOR (MIF)

The HAC Standard ANSI C63.19-2011 defines a new scaling using the Modulation Interference Factor (MIF) which replaces the need for the Articulation Weighting Factor (AWF) during the evaluation and is applicable to any modulation scheme.

The Modulation Interference factor (MIF, in dB) is added to the measured average E-field (in dBV/m) and converts it to the RF Audio Interference level (in dBV/m). This level considers the audible amplitude modulation components in the RF E-field. CW fields without amplitude modulation are assumed to not interfere with the hearing aid electronics. Modulations without time slots and low fluctuations at low frequencies have low MIF values, TDMA modulations with narrow transmission and repetition rates of few 100 Hz have high MIF values and give similar classifications as ANSI C63-2007.

Definitions

ER3D, E-field probes have a bandwidth <10 kHz and can therefore not evaluate the RF envelope in the full audio band. DASY52 is therefore using the "indirect" measurement method according to ANSI C63.19-2011 which is the primary method. These near field probes read the averaged E-field measurement. Especially for the new high peak-to-average (PAR) signal types, the probes shall be linearized by probe modulation response (PMR) calibration in order to not overestimate the field reading.

The evaluation method or the MIF is defined in ANSI C63.19-2011 section D.7. An RMS demodulated RF signal is fed to a spectral filter (similar to an A weighting filter) and forwarded to a temporal filter acting as a quasi-peak detector. The averaged output of these filtering is called to a 1 kHz 80% AM signal as reference. MIF measurement requires additional instrumentation and is not well suited for evaluation by the end user with reasonable uncertainty. It may alternatively be determined through analysis and simulation, because it is constraint and characteristic for a communication signal. DASY52 uses well defined signals for PMR calibration. The MIF of these signals has been determined by simulation and is automatically applied.

MIF values were not tested by a probe or as specified in the standards but are based on analysis provided by SPEAG for all the air interfaces (GSM, WCDMA, CDMA). For GSM, User Identifier (UID) UID 10021 was used; for WCDMA, UID 10011 was used. The data included in this report are for the worst case operating modes.

UID	Version Date	Communication System Name	MIF (dB)
10011 - DAA	30-May-14	UMTS-FDD (WCDMA)	-27.23
10021 - DAB	30-May-14	GSM-FDD (TDMA, GMSK)	3.63

A PMR calibrated probe is linearized for the selected waveform over the full dynamic range within the uncertainty specified in its calibration certificate. ER3D, EF3D and EU2D E-field probes have a bandwidth <10 kHz and can therefore not evaluate the RF envelope in the full audio band. DASY52 is therefore using the "indirect" measurement method according to ANSI C63.19-2011 which is the primary method. These near field probes read the averaged E-field measurement. Especially for the new high peak-to-average (PAR) signal types, the probes shall be linearized by PMR calibration in order to not overestimate the field reading.

The MIF measurement uncertainty is estimated as follows, for modulation frequencies from slotted waveforms with fundamental frequency and at least 2 harmonics within 10 kHz:

- 0.2 dB for MIF -7 to +5 dB,
- 0.5 dB for MIF -13 to +11 dB
- 1 dB for MIF > -20 dB

9. EVALUATION FOR LOW- POWER EXEMPTION

An RF air interface technology of a device is exempt from testing when its average antenna input power plus its MIF is ≤ 17 dBm for any of its operating modes. If a device supports multiple RF air interfaces, each RF air interface shall be evaluated individually.

Table 1: Average Antenna Input Power

Air Interface	Average Power (dBm)	
	Target (dBm)	Max. Rated Power (Target + Tune up Tolerance) (dBm)
GSM850	32.5	33.1
PCS1900	30.0	30.7
UMTS FDD 2	23.5	24.0
UMTS FDD 4	23.5	24.0
UMTS FDD 5	24.0	24.5

Table 2: Low Power Exemption Calculation

Air Interface	Max. Rated Power (dBm)	MIF (dB)	Input Power + MIF (dBm)	HAC Testing Required
GSM850	33.1	3.63	36.83	Yes
PCS1900	30.7	3.63	34.33	Yes
UMTS FDD 2	24.0	-27.23	-3.23	No
UMTS FDD 4	24.0	-27.23	-2.73	No
UMTS FDD 5	24.5	-27.23	-2.73	No

Conclusion:

RF Emission testing for this device is required only for GSM voice mode. All other applicable air-interfaces are exempt.

10. HAC RF EMISSIONS TEST PROCEDURE

The following are step-by-step test procedures.

- a) Confirm proper operation of the field probe, probe measurement system and other instrumentation and the positioning system.
- b) Position the WD (Wireless Device) in its intended test position.
- c) Set the WD to transmit a fixed and repeatable combination of signal power and modulation characteristic that is representative of the worst case (highest interference potential) encountered in normal use. Transiently occurring start-up, changeover, or termination conditions, or other operations likely to occur less than 1% of the time during normal operation, may be excluded from consideration.
- d) The centre sub-grid shall be centred on the T-Coil mode perpendicular measurement point or the acoustic output, as appropriate. Locate the field probe at the initial test position in the 50 mm by 50 mm grid, which is contained in the measurement plane, refer to illustrated in Figure 1. If the field alignment method is used, align the probe for maximum field reception.
- e) Record the reading at the output of the measurement system
- f) Scan the entire 50 mm by 50 mm region in equally spaced increments and record the reading at each measurement point. The distance between measurement points shall be sufficient to assure the identification of the maximum reading.
- g) Identify the five contiguous sub-grids around the centre sub-grid whose maximum reading is the lowest of all available choices. This eliminates the three sub-grids with the maximum readings. Thus, the six areas to be used to determine the WD's highest emissions are identified.
- h) Identify the maximum reading within the non-excluded sub-grids identified in step g).
- i) Convert the highest field reading within identified in step h) to RF audio interference level, in V/m, by taking the square root of the reading and then dividing it by the measurement system transfer function, established in 5.5.1.1 Convert this result to dB(V/m) by taking the base-10 logarithm and multiplying by 20.

Indirect measurement method

Replacing step i), the RF audio interference level in dB (V/m) is obtained by adding the MIF (in dB) to the maximum steady-state RMS field-strength reading, in dB (V/m), from step h). Use this result to determine the category rating

- j) Compare this RF audio interference level with the categories in Clause 8 (ANSI C63.19-2011) and record the resulting WD category rating
- k) For the T-Coil mode M-rating assessment, determine whether the chosen perpendicular measurement point is contained in an included sub-grid of the first scan. If so, then a second scan is not necessary. The first scan and resultant category rating may be used for the T-Coil mode M rating.

Otherwise, repeat step a) through step i), with the grid shifted so that it is centred on the perpendicular measurement point. Record the WD category rating.

HAC RF Emissions Test Procedure (Continued):**Figure 2 - WD reference and plane for RF emission measurements**

11. TEST FLOWCHART PER ANSI-PC63.19 2011

Test Instructions

- Confirm proper operation of probes and instrumentation
- Position WD
- Configure WD Tx Operation

(Step a-c)

- Initialize field probe and take first reading
- Scan Area

(Step d-f)

- Identify exclusion area
- Rescan or reanalyze open area to determine maximum
- Indirect method: Add the MIF to the maximum steady state rms field strength and record RF Audio Interference Level, in dB (V/m)

(Step g-i)

Identify & Record Category

(Step j)

12. EMISSIONS MEASUREMENT CRITERIA

WD RF Audio Interference Level Categories in Logarithmic Units

Category	Limits for E-Field Emissions < 960MHz	Limits for E-Field Emissions > 960MHz
M1	50 (dB V/m) - 55 (dB V/m)	40 (dB V/m) - 45 (dB V/m)
M2	45 (dB V/m) - 50 (dB V/m)	35 (dB V/m) - 40 (dB V/m)
M3	40 (dB V/m) - 45 (dB V/m)	30 (dB V/m) - 35 (dB V/m)
M4	<40 (dB V/m)	<30 (dB V/m)

13. HAC (RF EMISSIONS) TEST RESULTS

MIF values were not tested by a probe or as specified in the standards but are based on analysis provided by SPEAG for all the air interfaces (GSM, WCDMA). For GSM, User Identifier (UID) 10021 was used; for WCDMA, UID 10011 was used (Refer Section 8).

The data included in this report are for the worst case operating modes. Appendix 4 contains the attestation letter signed by the grantee that the MIF values represent worst case operation modes.

Scan No.	Operating Band	Channel Number	Frequency (MHz)	Measured Results (dB V/m)	EUT Class	Lab Temp. (°C)	Mod.
1	GSM 850	128	824.2	36.1	M4	24.0	GMSK
2		190	836.6	37.8	M4	24.0	GMSK
3		251	848.8	36.3	M4	24.0	GMSK
4	PCS1900	512	1850.2	32.47*	M3	24.0	GMSK
5		661	1880.0	30.88	M3	24.0	GMSK
6		810	1909.8	30.35	M3	24.0	GMSK
-	WCDMA	Refer to Section 9. Evaluation for Low-Power Exemption. RF Emissions testing for this device is required only for GSM Voice Mode. All other applicable Air-Interfaces are exempted from testing					
Worst Case results							
Band	Frequency (MHz)	Measured Results dB V/m		Upper Limit for E-Field Emission dB V/m		Margin dB V/m	
PCS1900	1880.0	32.47		35.00		2.53	

Note(s):

- According to the last paragraph of Section 8, the MIF measurement uncertainty is estimated to be 0.2 dB for MIF -7 to + 5 dB; Applying this to the table above, the maximum E-field result of **32.27 dB V/m** plus measurement uncertainty of 0.2 dB is **32.47 dB V/m**, which is still within M3 rating.

APPENDIX 1: HAC RF SCANS

This appendix contains RF distribution scans which are not included in the total number of pages for this report.

APPENDIX 2: CAL CERTIFICATES

This section contains the calibration certificates, data for the Probe(s) and Dipole(s) used, UID 10021 – DAA GSM Specification and UID 10011 – DAB WCDMA Specification. This is not included in the total number of pages for this report.

Accredited by the Swiss Accreditation Service (SAS)

The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates

Accreditation No.: SCS 108

Client **UL RFI UK**

Certificate No: **ER3-2260_Nov13**

CALIBRATION CERTIFICATE

Object **ER3DV6 - SN:2260**

Calibration procedure(s) **QA CAL-02.v8, QA CAL-25.v6**
Calibration procedure for E-field probes optimized for close near field
evaluations in air

Calibration date: **November 19, 2013**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^\circ\text{C}$ and humidity $< 70\%$.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID	Cal Date (Certificate No.)	Scheduled Calibration
Power meter E4419B	GB41293874	04-Apr-13 (No. 217-01733)	Apr-14
Power sensor E4412A	MY41498087	04-Apr-13 (No. 217-01733)	Apr-14
Reference 3 dB Attenuator	SN: S5054 (3c)	04-Apr-13 (No. 217-01737)	Apr-14
Reference 20 dB Attenuator	SN: S5277 (20x)	04-Apr-13 (No. 217-01735)	Apr-14
Reference 30 dB Attenuator	SN: S5129 (30b)	04-Apr-13 (No. 217-01738)	Apr-14
Reference Probe ER3DV6	SN: 2328	10-Oct-13 (No. ER3-2328_Oct13)	Oct-14
DAE4	SN: 789	15-May-13 (No. DAE4-789_May13)	May-14
Secondary Standards	ID	Check Date (in house)	Scheduled Check
RF generator HP 8648C	US3642U01700	4-Aug-99 (in house check Apr-13)	In house check: Apr-15
Network Analyzer HP 8753E	US37390585	18-Oct-01 (in house check Oct-13)	In house check: Oct-14

Calibrated by:	Name Jeton Kastrati	Function Laboratory Technician	Signature
Approved by:	Name Katja Pokovic	Function Technical Manager	Signature
Issued: November 19, 2013 This calibration certificate shall not be reproduced except in full without written approval of the laboratory.			

Accredited by the Swiss Accreditation Service (SAS)

Accreditation No.: **SCS 108**

The Swiss Accreditation Service is one of the signatories to the EA
 Multilateral Agreement for the recognition of calibration certificates

Glossary:

NORM _{x,y,z}	sensitivity in free space
DCP	diode compression point
CF	crest factor (1/duty_cycle) of the RF signal
A, B, C, D	modulation dependent linearization parameters
Polarization ϕ	ϕ rotation around probe axis
Polarization ϑ	ϑ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta = 0$ is normal to probe axis
Connector Angle	information used in DASY system to align probe sensor X to the robot coordinate system

Calibration is Performed According to the Following Standards:

- IEEE Std 1309-2005, "IEEE Standard for calibration of electromagnetic field sensors and probes, excluding antennas, from 9 kHz to 40 GHz", December 2005
- CTIA Test Plan for Hearing Aid Compatibility, April 2010.

Methods Applied and Interpretation of Parameters:

- NORM_{x,y,z}**: Assessed for E-field polarization $\vartheta = 0$ for XY sensors and $\vartheta = 90$ for Z sensor ($f \leq 900$ MHz in TEM-cell; $f > 1800$ MHz: R22 waveguide).
- NORM(f)_{x,y,z}** = NORM_{x,y,z} * frequency_response (see Frequency Response Chart).
- DCP_{x,y,z}**: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR**: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- A_{x,y,z}; B_{x,y,z}; C_{x,y,z}; D_{x,y,z}; VR_{x,y,z}**: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- Spherical isotropy (3D deviation from isotropy)**: in a locally homogeneous field realized using an open waveguide setup.
- Sensor Offset**: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle**: The angle is assessed using the information gained by determining the NORM_x (no uncertainty required).

Probe ER3DV6

SN:2260

Manufactured: May 18, 2001
Calibrated: November 19, 2013

Calibrated for DASY/EASY Systems
(Note: non-compatible with DASY2 system!)

DASY/EASY - Parameters of Probe: ER3DV6 - SN:2260

Basic Calibration Parameters

	Sensor X	Sensor Y	Sensor Z	Unc (k=2)
Norm ($\mu\text{V}/(\text{V}/\text{m})^2$)	1.37	1.50	1.75	$\pm 10.1 \%$
DCP (mV) ^B	99.8	100.9	101.5	

Modulation Calibration Parameters

		Y	3.81	65.4	18.2		117.0	
		Z	3.91	66.1	18.2		145.5	
10290-AAA	CDMA2000, RC1, SO55, Full Rate	X	4.37	67.7	19.5	3.91	140.9	$\pm 0.7 \%$
		Y	4.28	66.7	18.7		122.2	
		Z	3.88	64.8	17.2		111.3	
10295-AAA	CDMA2000, RC1, SO3, 1/8th Rate 25 fr.	X	9.33	84.1	34.2	12.49	113.5	$\pm 2.2 \%$
		Y	14.57	98.9	41.1		102.1	
		Z	17.96	98.7	38.6		111.8	

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for a normal distribution corresponds to a coverage probability of approximately 95%.

^B Numerical linearization parameter: uncertainty not required.

^E Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

Frequency Response of E-Field
(TEM-Cell:ifi110 EXX, Waveguide: R22)

Uncertainty of Frequency Response of E-field: $\pm 6.3\%$ (k=2)

Receiving Pattern (ϕ), $\vartheta = 0^\circ$

f=600 MHz,TEM,0°

f=2500 MHz,R22,0°

Receiving Pattern (ϕ), $\vartheta = 90^\circ$

f=600 MHz,TEM,90°

f=2500 MHz,R22,90°

Receiving Pattern (ϕ), $\vartheta = 0^\circ$

Uncertainty of Axial Isotropy Assessment: $\pm 0.5\%$ ($k=2$)

Receiving Pattern (ϕ), $\vartheta = 90^\circ$

Uncertainty of Axial Isotropy Assessment: $\pm 0.5\%$ ($k=2$)

Dynamic Range f(E-field)
(TEM cell , f = 900 MHz)

Uncertainty of Linearity Assessment: $\pm 0.6\%$ ($k=2$)

Deviation from Isotropy in Air

Error (ϕ , ϑ), $f = 900 \text{ MHz}$

Uncertainty of Spherical Isotropy Assessment: $\pm 2.6\%$ ($k=2$)

CALIBRATION CERTIFICATE

Object **CD835V3 - SN: 1000**
 Calibration procedure(s) **QA CAL-20.v6**
Calibration procedure for dipoles in air
Calibration date: **November 12, 2013**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
 The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature $(22 \pm 3)^{\circ}\text{C}$ and humidity $< 70\%$.

Calibration Equipment used (M&TE critical for calibration)

References

- [1] ANSI-C63.19-2011
American National Standard, Methods of Measurement of Compatibility between Wireless Communications Devices and Hearing Aids.

Methods Applied and Interpretation of Parameters:

- *Coordinate System:* y-axis is in the direction of the dipole arms. z-axis is from the basis of the antenna (mounted on the table) towards its feed point between the two dipole arms. x-axis is normal to the other axes. In coincidence with the standards [1], the measurement planes (probe sensor center) are selected to be at a distance of 15 mm above the top metal edge of the dipole arms.
- *Measurement Conditions:* Further details are available from the hardcopies at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated. The forward power to the dipole connector is set with a calibrated power meter connected and monitored with an auxiliary power meter connected to a directional coupler. While the dipole under test is connected, the forward power is adjusted to the same level.
- *Antenna Positioning:* The dipole is mounted on a HAC Test Arch phantom using the matching dipole positioner with the arms horizontal and the feeding cable coming from the floor. The measurements are performed in a shielded room with absorbers around the setup to reduce the reflections. It is verified before the mounting of the dipole under the Test Arch phantom, that its arms are perfectly in a line. It is installed on the HAC dipole positioner with its arms parallel below the dielectric reference wire and able to move elastically in vertical direction without changing its relative position to the top center of the Test Arch phantom. The vertical distance to the probe is adjusted after dipole mounting with a DASY5 Surface Check job. Before the measurement, the distance between phantom surface and probe tip is verified. The proper measurement distance is selected by choosing the matching section of the HAC Test Arch phantom with the proper device reference point (upper surface of the dipole) and the matching grid reference point (tip of the probe) considering the probe sensor offset. The vertical distance to the probe is essential for the accuracy.
- *Feed Point Impedance and Return Loss:* These parameters are measured using a HP 8753E Vector Network Analyzer. The impedance is specified at the SMA connector of the dipole. The influence of reflections was eliminating by applying the averaging function while moving the dipole in the air, at least 70cm away from any obstacles.
- *E-field distribution:* E field is measured in the x-y-plane with an isotropic ER3D-field probe with 100 mW forward power to the antenna feed point. In accordance with [1], the scan area is 20mm wide, its length exceeds the dipole arm length (180 or 90mm). The sensor center is 15 mm (in z) above the metal top of the dipole arms. Two 3D maxima are available near the end of the dipole arms. Assuming the dipole arms are perfectly in one line, the average of these two maxima (in subgrid 2 and subgrid 8) is determined to compensate for any non-parallelity to the measurement plane as well as the sensor displacement. The E-field value stated as calibration value represents the maximum of the interpolated 3D-E-field, in the plane above the dipole surface.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Measurement Conditions

DASY system configuration, as far as not given on page 1.

DASY Version	DASY5	V52.8.7
Phantom	HAC Test Arch	
Distance Dipole Top - Probe Center	15mm	
Scan resolution	dx, dy = 5 mm	
Frequency	835 MHz $\pm$ 1 MHz	
Input power drift	< 0.05 dB	

Maximum Field values at 835 MHz

E-field 15 mm above dipole surface	condition	Interpolated maximum
Maximum measured above high end	100 mW input power	108.8 V / m
Maximum measured above low end	100 mW input power	108.6 V / m
Averaged maximum above arm	100 mW input power	108.7 V / m $\pm$ 12.8 % (k=2)

Appendix

Antenna Parameters

Frequency	Return Loss	Impedance
800 MHz	17.6 dB	46.7 Ω - 12.4 j Ω
835 MHz	23.6 dB	52.2 Ω + 6.4 j Ω
900 MHz	15.7 dB	59.7 Ω - 15.4 j Ω
950 MHz	25.3 dB	45.6 Ω + 2.7 j Ω
960 MHz	18.1 dB	49.6 Ω + 12.4 j Ω

3.2 Antenna Design and Handling

The calibration dipole has a symmetric geometry with a built-in two stub matching network, which leads to the enhanced bandwidth.

The dipole is built of standard semirigid coaxial cable. The internal matching line is open ended. The antenna is therefore open for DC signals.

Do not apply force to dipole arms, as they are liable to bend. The soldered connections near the feedpoint may be damaged. After excessive mechanical stress or overheating, check the impedance characteristics to ensure that the internal matching network is not affected.

After long term use with 40W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

MIF Attestation Letter - PY7PM-0800

Attn: Office of Engineering and Technology
Re: HAC Attestation – FCC ID: PY7PM-0800

To whom it may concern
Sony Mobile Communications Inc, hereby declares that the MIF values detailed below are based on worst case operating modes for all air interfaces for which the HAC rating is provided based on the current methodology for determining MIF values.

Reference Test Report Number(s): **UL Verification Services Test Report UL-HAC-RP10295085JD10A V1.0**

SPEAG Test Files		
UID	Communication System Name	MIF(dB)
10021-DAA	GSM-FDD (TDMA, GMSK)	3.63
10011-CAB	UMTS-FDD (WCDMA)	-27.23

Yours sincerely
