4.1 EUT description

EUT is auxiliary equipment for connecting GSM mobile phone and Bluetooth headset.

The EUT was not modified during the tests.

5 EUT TEST SETUPS

For each test the EUT was exercised to find out the worst case of operation modes and device configuration.

Two different test setups were used: one for conducted measurements, another for radiated measurements. One EUT was equipped with an external antenna connector for conductive measurements.

The test setup photographs are in the document referenced in section 17.

6 APPLICABLE STANDARDS

The tests were performed in guidance of CFR 47 Part 15.247 and 15.207, Part 2, FCC public notice DA 00-705 (March 30, 2000), ANSI C63.4 (1992), RSS-210 (Issue 5, November 2001) and CISPR-22.

Deviations, modifications or clarifications (if any) to above mentioned documents are written in each section under "Test method" for each test case.

EUT TX power level	0 dBm

9.2.2 Results

Table 3: Time of occupancy during inquiring mode measurement results

Limit	Result
≤ 0.4 s over 12.8 s period	0.092 s

Limit:

In the inquiry mode Bluetooth uses a reduced hopping pattern (32 channels). As defined in §15.247 (a) (1) iii, the limit for time of occupancy is 0.4s over time of number of channels multiplied with 0.4s ($32 * 0.4\text{s} = 12.8\text{ s}$).

Results:

The complete inquiry cycle took $2.547 + 2.534 = 5.081$ s, during which the transmitter operated at every 10.0 ms.

The duration of one transmission was 181.8 μs .

Based on these measurements, one channel was occupied $(5.081\text{ s} / 10.0\text{ ms}) * 181.8\text{ }\mu\text{s} = 0.092\text{ s}$ during the 12.8 s period.

9.3.2 Results

Table 4: Time of occupancy during connection mode measurement results

Limit	Result
≤ 0.4 s over 31.6 s period	0.165 s

Limit:

In the connection mode Bluetooth uses 79 channels. As defined in §15.247 (a) (1) iii, the limit for time of occupancy is 0.4s over time of number of channels multiplied with 0.4s ($79 * 0.4s = 31.6$ s).

Results:

In measurement time of 31.6 s, total of 57 transmissions occurred. The duration of one transmission was 2.9ms. Based on these measurements the transmitter operated $57 * 2.9$ ms = 0.165 s during the 31.6 s period

15.1 Test setup

The Bluetooth simulator was used to:

- set the EUT channel (0 – 78)
- set the number of EUT TX slots (1, 3, 5)

Picture 32: Test setup for radiated spurious emissions measurement on above 3 GHz frequencies

15.2 Test method

1. The emissions were searched and maximized by moving the turntable, changing the measuring antenna polarization and height and manipulating the EUT.
2. The worst EUT orientation was searched EUT in middle channel. The lowest and highest channels were measured in that orientation.
3. Levels of suspicious signals and levels of EUT transmitter harmonics were recorded.
4. The recorded levels were corrected in the automated test system with the measurement antenna factor, cable attenuations and filter attenuation.
5. The corrected values, giving the EUT radiated spurious emission levels as dB μ V/m at 3 m (1m over 3GHz) distance, are reported.

As default, all emissions were compared against the general limits. If any emission exceeded that limit, it was further checked, if it was outside the restricted band thus complying with the -20dBc requirement.

15.5 Results

Measurement system noise level was least 15 dB below the spurious emission limit. Only levels of suspicious signals and transmitter harmonic frequencies, which were above the measurement system noise, are reported.
