4.2.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

NOTE:

1. The resolution bandwidth of test receiver/spectrum analyzer is 120kHz for Quasi-peak detection at frequency below 1GHz.
2. The resolution bandwidth is 1MHz and video bandwidth of test receiver/spectrum analyzer is 3MHz for Peak detection at frequency above 1GHz. The resolution bandwidth of test receiver/spectrum analyzer is 1 MHz for Average detection (AV) at frequency above 1GHz.

 2. Correction Factor (dB/m) = Antenna Factor (dB/m) + Cable Factor (dB).
 3. The other emission levels were very low against the limit.
 4. Margin value = Emission level – Limit value.
 5. “ * ”: Fundamental frequency.
 6. The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on 0.625 * 5 per 296.25 ms per channel. Therefore, the duty cycle correlation factor be equal to: $20\log(3.125 / 100) = -30.1$ dB.
 7. Average value = peak reading + $20\log(\text{duty cycle})$.
 8. "#":The radiated frequency is out the restricted band.

NOTE 1:

The band edge emission plot on the next page shows 58.7dBc between carrier maximum power and local maximum emission in restrict band (2.3762GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 104.8dBuV/m (Peak), so the maximum field strength in restrict band is $104.8 - 58.7 = 46.1$ dBuV/m, which is under 74 dBuV/m limit.

Average value = $46.1 - 30.10 = 16$ dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on $0.625 * 5$ per 296.25 ms per channel. Therefore, the duty cycle be equal to: $20\log(3.125/100) = -30.1$ dB.

Average value = peak reading -30.10 .

NOTE 2:

The band edge emission plot on the next second page shows 60.2dBc between carrier maximum power and local maximum emission in restrict band (2.4838GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 102.1dBuV/m (Peak), so the maximum field strength in restrict band is $102.1 - 60.2 = 41.9$ dBuV/m, which is under 74 dBuV/m limit.

Average value = $41.9 - 30.10 = 11.8$ dBuV/m, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on $0.625 * 5$ per 296.25 ms per channel. Therefore, the duty cycle be equal to: $20\log(3.125/100) = -30.1$ dB.

The band edge emission plot on the next page shows 61.1dBc between carrier maximum power and local maximum emission in restrict band (2.3762GHz). The emission of carrier strength list in the test result of channel 0 at the item 4.2.7 is 106dBuV/m (Peak), so the maximum field strength in restrict band is $106 - 61.1 = 44.9\text{dBuV/m}$, which is under 74 dBuV/m limit.

Average value = $44.9 - 30.1 = 14.8\text{dBuV/m}$, which is under 54dBuV/m limit.

The band edge emission plot on the next second page shows 59.2dBc between carrier maximum power and local maximum emission in restrict band (2.4835GHz). The emission of carrier strength list in the test result of channel 78 at the item 4.2.7 is 105.6dBuV/m (Peak), so the maximum field strength in restrict band is $105.6 - 59.2 = 46.4\text{dBuV/m}$, which is under 74 dBuV/m limit.

Average value = $46.4 - 30.10 = 16.3\text{dBuV/m}$, which is under 54dBuV/m limit.

*The DH5 packet was the worse case duty cycle for a transmit dwell time on a channel, based upon bluetooth theory the transmitter is on $0.625 * 5$ per 296.25 ms per channel. Therefore, the duty cycle be equal to: $20\log(3.125/100) = -30.1\text{ dB}$.
