## 1.1. EUT and Accessory Information

The EUT is a mobile phone with following features:  
 GSM/WCDMA/WLAN/Bluetooth  
 The EUT is tested with maximum rated TX power.

**2.1.1 Test setup**

**2.2. Test method and limit**

The measurement is made according to TIA-603-C-2004 as follows:

The measurement is performed in the Anechoic Chamber with absorbers on the floor and measuring antenna at fixed height using 2-axis EUT position system. The turntable is rotated 360 degrees and this is repeated for both horizontal and vertical receive antenna polarizations.

The EUT is placed on a nonconductive plate at 170 cm height.

The substitution method is used. The measurement results are obtained as described below:

$$P[dBm] = P_{SUBST\ TX} + P_{MEAS} - P_{SUBST\ RX} - L_{SUBST\ CABLES} + G_{SUBST\ TX\ ANT}$$

Where  $P_{SUBST\ TX}$  is signal generator level.  $P_{MEAS}$  is measured power level from the EUT.  $P_{SUBST\ RX}$  is measured power level in substitute measurement.  $L_{SUBST\ CABLE}$  is the loss of the cable between the signal generator and the substitution antenna and  $G_{SUBST\ TX\ ANT}$  is substitution antenna gain.

The RF power levels were measured in conducted manner with all CBWs. The CBW with highest power was selected for radiated tests.

Limits for radiated RF output power measurements

#### 3.1.1 Test setup

#### 3.2. Test method and limit

The measurement is made according to TIA-603-C-2004 as follows:

The measurement is divided into the Preliminary Measurement and the Final Measurement.

The suspected frequencies are searched for in Preliminary Measurement with absorbers on the floor and measuring antenna at fixed height using 2-axis EUT position system.

The Final Measurement is performed in the Semi-Anechoic Chamber with conducting metal floor, if the Preliminary Measurement results are closer than 20 dB to the permissible value.

The EUT is placed at nonconductive plate at the turntable center.

For each suspected frequency, the turntable is rotated 360 degrees and antenna is scanned from 1 to 4 m. This is repeated for both horizontal and vertical receive antenna polarizations.

The emissions less than 20 dB below the permissible value are reported.

The measurement is made up to 10th harmonic of the EUT highest TX channel.

The substitution method is used.

The measurement results are obtained as described below:

$$P [dBm] = P_{SUBST TX} + G_{SUBST TX ANT} - L_{SUBST CABLE}$$

Where  $P_{SUBST TX}$  is signal generator level, which produces the same receiver reading  $P_{MEAS}$  in dBm as EUT.  $G_{SUBST TX ANT}$  is substitution antenna gain and  $L_{SUBST CABLE}$  is the loss of the cable between the signal generator and the substitution antenna.

Previous evaluations have shown, that the currently selected CBW/RB configurations represent the worst case for this test. The evaluations are repeated every now and then to ensure, that the selections remain valid.
