2.1 Test Facilities

The tests and measurements refer to this report were performed by EMC testing Lab. of Guangzhou Testing & Inspection Institute for Household Electric Appliances.

Add. : 204 Xingang West Road Guangzhou 510302 P.R. China
Telephone : 86-20-84451692
Fax : 86-20-84183160

The EMC testing laboratory has been recognized by China National Commission for Laboratory Assessment, and authorized by Nemko of Norway since 1997(Aut. No. ELA139), and authorized by TÜV Rheinland of Germany since 1998(Aut. No. 9868976-1216), and registered by FCC since 2001(Registered No. 102430).

2.2 Description of Non-standard Method and Deviations

The testing and measurement method used in this report are all the standard method applied, no non-standard method and deviations from the used standard were used.

2.3 List of Test and Measurement Instruments

Refer to **Appendix A**.

3. Test Set-up and Operation Modes

3.1 Principle of Configuration Selection

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the Operating Instructions.

3.2 Physical Configuration for Testing

Refer to relative descriptions in this test report.

3.3 Test Operation Mode and Test Software

Refer to **Test Setup**.

3.4 Special Accessories and Auxiliary Equipment

None.

3.5 Countermeasures to Achieve EMC Compliance

None.

4. Emission test results (intentional radiator)

Perform ElectroMagnetic Interference measurement in accordance with FCC 47CFR [Codes of Federal Regulations] Part 15 and ANSI C63.4:2003 for FCC Certification.

Test Standards and Results Summary					
Test Condition	Test Requirement	Test Method	Test Result

Note: N/A - Not Applicable

According to FCC 47CFR 15.231(a), the following conditions shall be met to comply with the provisions for this periodic operation:

- (1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.
- (2) A transmitter activated automatically shall cease transmission within 5 seconds after activation.

The EUT is to transmit RF signal while each button is being pressed and ceases transmission almost immediately upon being released. The transmitting time and the receiving time are within not more than 5 seconds.

4.1 Conducted emission (0.15MHz~30MHz)

RESULT : N/A

Remark:

The appliance is not connected to the supply main, so the test is not applicable.

4.2 Radiated emission (Above 30 MHz)

RESULT : **Pass**

Test procedure : ANSI C63.4 : 2003
Frequency range : 30 MHz ~ 5GHz
Limits : FCC PART 15, Subpart C, Section 15.209
FCC PART 15, Subpart C, Section 15.231(b)
Test Site : 3m Anechoic Chamber (Registration Number: 102430)

Test Method:

The EUT was placed on a wooden turntable, which could rotate from 0° to 360°, 0.8m high above the ground, at a distance of 3m in anechoic chamber, from the receiving broadband antenna, which was mounted on the antenna tower. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results below.

(1). Radiated Emissions limits, general requirement [FCC 47 CFR 15.209]

Frequency Range. (MHz)	Field Strength ($\mu\text{V/m}$) Average detector	Field Strength ($\mu\text{V/m}$) Peak detector	Distance (m)
30-88	100	1000	3

216-960	200	2000	3
Above 960	500	5000	3

(2). Radiated Emissions limits, additional provisions [FCC 47 CFR 15.231(b)]:

Frequency Range. (MHz)	Field Strength of Fundamental ($\mu\text{V/m}$)	Field Strength of Spurious Emissions ($\mu\text{V/m}$)
40.66-40.70	2250	225
70-130	1250	125
130-174	1250 to 3750**	125 to 375**
174-260	3750	375
260-470	3750 to 12500**	375 to 1250**
Above 470	12500	1250

Note: ** linear interpolations

Where F is the frequency in MHz, the formula for calculating the maximum permitted fundamental field strengths is as follows: for 315MHz, $\mu\text{V/m}$ at 3 meters = $41.6667 \times (F) - 7083.3333 = 6041.67(\mu\text{V/m})$. The maximum permitted unwanted emission level is 20 dB below the maximum permitted fundamental level.

Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in Section 15.209, whichever limit permits stricter field strength.

The field strength of emissions appearing within restricted bands of operation shall not exceed the limits shown in Section 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions.

*The average value limits are used for comparing with measured peak value.

Remarks:

- Calculated measurement uncertainty is 5.9dB from 30MHz to 1GHz.
- Field strength of Fundamental for Average detector is $41.6667 \times 315-7083.3333 = 6041.67\mu V/m$
- Because the peak value complies with average limit, the average value is not needed to be measured, and the duty cycle correction factor for determining the average value is not needed to be measured.
- Peak detector was used in the following graphs.

4.3 20dB Bandwidth of Fundamental Emission

RESULT : **Pass**

Test procedure : ANSI C63.4 : 2003
 Limits : FCC PART 15, Subpart C, Section 15.231(c)
 Test Site : 3m Anechoic Chamber (Registration Number: 102430)

Test Method:

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

Test Setup:

As Test Setup of clause 4.2 in this test report.
